# CLASSIFICATION AND INSERTION OF VESSELS IN THE REGISTER OF THE BUREAU VERITAS

The **BUREAU VERITAS** is a Society for the Classification and Registration of all types of vessels.

It is managed by a Board of Administration composed of seven Members appointed by the General Assembly in conformity with the statutes.

The Rules regulating the construction and surveying of ships are established by a Technical Committee whose Members are appointed by the Board of Administration.

The Classification of a vessel is based upon these Rules taken in conjunction with the result of Inspection by the Society's Surveyors, who are stationed at the principal shipping ports throughout the world.

The Class so determinated and assigned by the **BUREAU VERITAS** is inscribed in the Classification Certificate and inserted with other particulars in the supplements and afterwards in the Register, which is published annually. Any alteration to the class or information thereto is duly noted in the Supplements printed and issued fortnightly.

From its origin the Society has adopted a fractional system to denote the class or express its appreciation of vessels. The marks or signs **3/3** or **3 T**, **5/6** or **5 S**, **3/1** or **3 Q**, **2/3** or **2 T**, **1 2** or **M**, etc., constitute a formule of classification which remains its personal property.

This right has been recognised by all the competent courts of law.

Therefore the use of these signs or fractions, or of signs similar to them, employed to express the degree of confidence placed in a ship, will be prosecuted as counterfeit to the utmost rigour of the law.

For full information as to the symbols of classification reference should be made to the Rules.

The Administration beg to call the attention of Shipowners to the Rules and Regulations for the Classification of Vessels. Shipowners should be convinced of the necessity of submitting their vessels regularly to the surveys required by the Rules.

The parties interested are requested to examine the particulars given on the Certificates and verify the accuracy of the information published in the Register and Supplements.

Any complaints should be addressed to the Administration.

The Administration decline all responsibility for any errors or omissions which may be found in the Register or Supplements.

Errors or changes will be corrected in the Supplements.

It is understood that the opinion of the **BUREAU VERITAS** regarding a vessel as expressed by class symbols or characters, although it may be questioned or discussed by the parties interested, cannot however give rise to actions at law against the **BUREAU VERITAS** or interested parties.

When application is made for survey, it is to be understood that the applicants are willing to abide by the rules. Application for survey should be made in writing.

The Surveyors must have free access to vessels classed in the Register at all times in order to ascertain their condition.

Surveyors' reports, and all other documents relating to the Classification of vessels, cannot be communicated to third parties without the express consent of those interested.

As an Association for the survey and registry of shipping the **BUREAU VERITAS** has been appointed by the Board of Trade to approve and certify on their behalf the position of the load line Disc on any vessel for the purposes of the Merchant Shipping Act of 1894.

Forms of application for the assignment of freeboards can be obtained at any office of the Society.

# REGULATIONS

OF THE

UNDERWRITERS' INTERNATIONAL UNION AGAINST THE RISKS RESULTING FROM THE CARRIAGE OF GOODS

ESTABLISHED BY THE BUREAU VERITAS

for the stowage of corn and grain cargoes of all kinds in bulk for the navigation of the European seas.

---

The Surveyors of the *Underwriters' International Union* are instructed to deliver at the request of Shipowners Captains or Charterers a certificate of good stowage of corn or grain cargoes of all kinds laden in bulk.

The Surveyors must inspect the vessel before she takes in cargo, during loading and also before she sails; they must be guided by the following prescriptions.

This survey does not in any way relieve the captain of his responsibility.

## REGULATIONS.

### I.

All vessels loading corn or grain in bulk, to have their ceiling caulked up to the upper turn of the bilges. In wooden vessels, the said ceiling will be chinsed up to the underside of the deck, so as to prevent the corn or grain in bulk from choking the pumps.

In iron vessels it is not necessary to chins the sides above the ceiling of the bottom.

### II.

All vessels to have a platform resting upon crossttimbers placed so as not to hinder the water from running down. In flat bottomed vessels, the platform must be at least 20 centimeters (8 English

inches) high at the keelson, this height to be raised to 25 centimeters (10 English inches) at the bilges (\*).

In sharp built vessels the platform must have at the keelson and bilges a height of 15 centimeters (6 English inches) and in vessels, having a very great rise of floor the height shall be at the keelson 18 centimeters (7 English inches) and at the bilges 5 centimeters (2 English inches). In vessels under 150 tons the height of the platform may be reduced to two-thirds from that required above.

The crossttimbers should not be more than 30 centimeters (12 English inches) apart.

If preferred by the Captain, dunnage wood, boards or staves may

---

(\*) The depth of the platform will be found in the different heights mentioned hereafter.

be substituted to the platform, but then the Surveyor will have to ascertain that this be so arranged, that it allows a free draining of the water.

Steamers with a double bottom shall have a wood ceiling resting upon crossttimbers 4 centimeters (1 1/2 English inch) thick. The tops of the waterballast tanks must be provided with water courses.

### III.

The platform, in the bottom of the vessel, will be covered with a double lining of mats or sails; the masts, the bitts, the pump-well, the chain-lockers and the watertanks, whether they be iron or wood, will be protected by laths, and also lined with good mats. This lining must be sufficiently close to prevent the corn from finding its way into the space between the timbers.

If the platform is made with boards well fastened together and clincher-built, no mats or sails will be required, but the loose knots which may be found in the planks must be covered over.

The pump-well of vessels above 200 tons must have sufficient dimensions to allow a man to have access down to the well.

### IV.

All vessels having a maximum width of 10 meters (33 English feet) must have amidship a longitudinal bulkhead, extending from the deck to half the depth of hold. In vessels loading grain or barley, the longitudinal bulkhead will extend at least from the deck, down to two-thirds of the depth.

The boards of these bulkheads must be at least 4 centimeters 1 1/2 English inch) thick and properly secured on both sides of the stanchions. The size of the stanchions is regulated by the depth of hold of the vessel; they must be firmly secured to the deckbeams as well as to the keelson; the distance between the stanchions shall not exceed 2<sup>m</sup>74 (9 English feet).

If the distance between the stanchions is not over 2<sup>m</sup>,13 (7 English

feet), the boards of the bulkheads will not be required to be more than 33 millimeters (1 1/4 English inch) thick.

For vessels having a maximum capacity of 200 quarters and navigating in the Baltic or along the coast, longitudinal bulkheads will not be required; for vessels having another navigation and whose hold is divided, by transversal bulkheads, in several compartments, no longitudinal bulkhead will be required in the compartments fore and aft, unless the capacity of these compartments exceeds 200 quarters.

### V.

In vessels with more than 3<sup>m</sup> (10 English feet) depth of hold under the upper deck or under the lower deck, the longitudinal bulkhead will be stayed by shores firmly secured to every other stanchion and to the sides of the vessel. These shores shall be placed at one-third of the depth of hold, measured from the deck down, and firmly secured to every other stanchion at both ends, so that shifting becomes impossible when the vessel rolls.

### VI.

The stanchions of the deck or 'tweendeck may be double, so as to allow the boards to slide in between them. In such case, the boards of the bulkheads shall be proportionally increased in thickness and will be at least 6 1/2 centimeters (2 1/2 English inches) thick. The double stanchions will be carefully attached to the deckbeams, as well as to the keelson.

If the distance between these stanchions does not exceed 2<sup>m</sup>,13 (7 English feet) the boards of the bulkheads need only be 5 centimeters (2 English inches) thick.

### VII.

If the width of the vessel inside the ceiling be over 10<sup>m</sup>

(33 English feet) two longitudinal bulkheads will be required, instead of the single one specified in § IV; they will be placed at one-third of the vessel's beam; these bulkheads must extend from the deck down to half the depth of hold.

If the vessel has lower deck beams, the stanchions of the bulkheads must extend down in the hold and be strongly secured to the beams of the deck and to those of the lower-deck. These bulkheads will be arranged like that required amidships for narrower vessels and shall be stayed by shores, secured to the stanchions and to both sides of the vessel, under the lower deck beams.

#### VIII.

As the side compartments in vessels having two bulkheads, will be the first to be filled up, a board will be left out at the top, to allow the remaining part to be filled up to the deck; the bulkheads will afterwards be closed and covered with good mats.

#### IX.

In vessels whose beam exceeds 10<sup>m</sup>,70 (35 English feet) and which have no lower deck, in addition to the above prescriptions, there will be required a platform on that part of the corn which is laden in bulk, and this platform will be covered with at least three layers of corn in sacks.

#### X.

If the vessel has a complete lower deck, a longitudinal bulkhead will be required in her hold.

The longitudinal bulkhead in the 'tweendeck must extend from the upper to the lower deck.

The hatchways of the lower deck will remain open, so as to facilitate the filling of the hold, when the cargo settles down.

If preferred, a platform may be established in the hold of such vessels, on the corn laden in bulk, instead of the longitudinal bulkhead; the said platform being afterwards covered with at least three layers of corn in sacks.

#### XI.

In vessels with two decks or two decks and a tier of holdbeams having a depth measured from the upper edge of the floors, exceeding 2/3rds of the vessel's width measured off the *ceiling*, two longitudinal bulkheads will be required in the 'tweendeck extending from upper to lower deck forming a trunk.

The two compartments on the starboard and port side shall remain empty, so as to avoid overloading and to assure a good stability to the vessel.

The hatchways of the lower deck will remain open, so as to facilitate the filling of the hold when the cargo settles down.

In the hold of such vessels, a longitudinal bulkhead will be required amidship's, the said bulkhead extending from the lower deck down to one-third of the depth of hold. In vessels which besides two decks have a tier of hold beams, the stanchions of the bulkheads shall be solidly connected to these beams and shall also be stayed by shores.

#### XII.

The longitudinal bulkheads will be provided between the beams with additional boards mounting up to the deck to which they must be well fixed. If the longitudinal bulkhead consists of a double set of boards running on each side of the stanchions, one of these two partial partitions will only come up to the deck as stated above. The longitudinal bulkheads will be covered with a lining of good mats or sails fastened to the deck so as to prevent the corn or seeds from finding their way through the seams of the planks.

In all cases, it is recommended to stow the grain up to the deck and not only to the lower side of the beams.

XIII.

If a vessel, through being overloaded, cannot be entirely filled, she will be fitted forward and aft in the hold, with transversal bulkheads extending from the deck down to the hold. If the vessel has a lower or orlop deck forward and aft, it will be sufficient to load completely the hold and to have the transversal bulkheads descending down to that lower deck.

The transversal bulkheads will be inclined to an angle of 60 or 70 degrees, so that the space between the two bulkheads be narrower under the deck, than at the bottom of the hold. It will thus more effectually resist the pressure of the cargo. They will also, like the longitudinal bulkheads, be supported by shores.

XIV.

All the wood used in the construction of the platforms, the ceilings and the bulkheads must be dry, the use of damp or wet wood is interdicted.

XV.

The Surveyor, when the lining of the fore and after part of the vessel will take place, shall take care that the mats be disposed so

as to prevent the corn from finding its way through the laps of the mats, when the corn is allowed to run forward and aft when oading.

XVI.

No corn or grain cargoes, either in bulk or in sacks, will be allowed to be stowed in spardecks, hurricanedecks or awningdecks, nor either in poops or forecastles.

In the case only when vessels will be unable to load sufficiently by the stern, they will by exception be allowed to take cargo in the poop or in the spardeck, but then only in sacks.

XVII.

The above prescriptions are not applicable to the navigation of rivers or interior trade.

XVIII.

Vessels which only load one-third of their cargo in bulk and the other two-thirds in sacks, must be provided with a platform, as prescribed by art. II of the Regulations, but the longitudinal bulkheads may be dispensed with. When more than one-third is loaded in bulk, then all prescriptions of these rules are obligatory.

---

# STOWAGE-REGULATIONS

FOR

VESSELS WITH CARGOES OF GRAIN, OR GRAIN AND GENERAL MERCHANDISE

FROM

PORTS OF THE UNITED STATES OF AMERICA TO EUROPEAN PORTS

---

The following rules, which have been approved by the *Bureau Veritas*, must be observed by all vessels loading grain insured by members of the International Underwriters' Association.

## A

### Loading all bulk, or part bulk and part bags.

#### I.

##### THE PUMP-WELL.

All vessels must have a pump-well sufficiently large to admit of the passage of a man to the bottom of the hold with room to work conveniently when there, say not less than four feet fore and aft, and five feet athwartship.

Access thereto must be practicable at all times either by a man-hole through the upperdeck, or by a clear passage-way through the 'tweendecks from the after hatch.

In no case must it be from the main hatch.

#### II.

All vessels shall have their ceiling if necessary caulked up to the upper turn of the bilges.

The pump-well, chain-lockers, the masts and watertanks, whether of wood or iron, must be properly cased to prevent damage.

The air strakes, all knees, the bitts and open seams must be cleated grain tight. 'Tweendeck scuppers must be closed.

#### III.

##### DUNNAGE.

All vessels must have a platform in the bottom upon the ceiling, which must rest upon sleepers of scantling  $3 \times 4$  inches, not more than 12 inches apart, supported by studs of corresponding size, also 12 inches apart and supplied with good channels for a free draining of the water to the pumps. The platform must be raised in medium vessels at least twelve inches from the flat of the floor, in the bilges fifteen inches, and in vessels which are very flat or sharp increased or diminished at the discretion of the Inspector. In no case must the platform be laid on

loose dunnage, nor must it be laid on the bilge keelsons, even when such keelsons may be more than 12 inches high, but there must always be sufficient room for the free passage of water under it. The platform must be laid with two thicknesses of one inch boards overlapping at the edges and ends, and care must be taken that it be perfectly tight to prevent any grain from passing through. The floor is considered as extending from the keelson to the sides of the vessel and not as terminating at the bilge keelsons.

Steamers with a double bottom are not subjected to the prescriptions of this section, but shall have a wooden platform resting upon crossttimbers 1  $\frac{1}{2}$  inch thick. The latter must be provided with water courses.

The sides of wooden vessels above the turn of the bilges must be ceiled after the manner of clapboarding reversed and properly furred, so as to turn water from the grain and cleated tight to prevent the grain from choking the pumps. For iron vessels it is not necessary to raise the floor, when the cargo platform is sufficiently high and no ceilings will be required above the fixed platform.

#### IV.

##### TRANSVERSE AND TRIMMING BULKHEADS.

If a vessel cannot be entirely filled, transverse bulkheads of strong boards must be fitted forward and aft at suitable places.

These transverse bulkheads must extend in single deck vessels or in vessels with one deck and beams from the deck down to the bottom of the hold, in vessels with a 'tweendeck laid forward and aft or in vessels with a complete 'tweendeck throughout its entire length, they shall extend only from the upper to the lower deck.

These transverse bulkheads are to be fixed at an angle of 60 or 70 degrees, so that the space enclosed between them is narrower under the deck than at the bottom of the hold, in order more effectually to resist the pressure of the cargo. Vessels with one deck, or one deck and beams must have, in addition to the forward and

after bulkheads 2 trimming bulkheads extending  $\frac{3}{4}$  down and so placed that, in loading, the middle compartment will be entirely filled and the end ones left to trim the vessel.

#### V.

##### SHIFTING BOARDS.

Vessels up to 33 feet beam must have amidships a longitudinal bulkhead or shifting boards two inches thick, extending from the keelson to the upperdeck, on each side of the stanchions. Vessels over 33 feet beam must have two longitudinal bulkheads or shifting boards each at one-third of the vessel's beam and extending in vessels with one deck or with one deck and beams from the floor to the upper deck.

Vessels with two fixed decks, with or without a tier of holdbeams, shall have two longitudinal bulkheads in the 'tweendeck, extending from the upper to the lower deck and one longitudinal bulkhead in the lower hold, extending from the 'tweendeck to the keelson.

As the side compartments in vessels, having two bulkheads, will be the first to be filled up, a board must be left open in the upper part of the bulkheads to allow the grain to be well filled up; the bulkheads will afterwards be carefully closed.

The deck or 'tweendeck stanchions may be double, so as to allow the boards of the longitudinal bulkheads to slide in between them.

In such case the boards of the bulkhead must be at least 4 inches thick.

#### VI.

##### STANCHIONS AND STUDS.

The stanchions not to be removed but firmly secured with good clamps to the deckbeams as well as to the keelson and not more than nine feet apart. In case the stanchions are over seven feet apart, or if the vessel's depth of hold exceeds 10 feet under the upper or the lower deck, the longitudinal bulkhead shall further be

stays by shores firmly secured to every alternate stanchion and to the sides of the vessel at one-third of the depth from the deck. The size of the stanchions is regulated by the depth of hold of the vessel. The transverse bulkheads must also have studs of one entire piece of spruce or pine, extending the depth of the vessel and to be set 18 inches apart. The shores and studs must also rest in good clamps so that shifting becomes impossible. The shores and studs must be not less than  $4 \times 6$  inches, but for vessels of a greater depth than 14 feet, the studs must be  $4 \times 8$  inches.

The forward bulkhead will require extra security.

#### VII.

##### LAYERS OF GRAIN IN BAGS OVER THE BULK CARGO.

Vessels which intend to load  $\frac{2}{3}$  of their cargo in bulk and  $\frac{1}{3}$  in bags must have, when bags are stowed on loose grain, a layer of boards under them, to prevent the bags from settling into the bulk cargo. In reference to end compartments as specified in Rule IV, if not entirely filled, the loose grain must be covered by bags of grain and properly stowed as above.

#### VIII.

Double decked vessels are required to leave off the 'tweendeck hatches, and to take up two streaks of 'tweendeck planks on each side from fore to aft as regulated by the Inspector, say about five feet from the waterways, so as to facilitate the gradual filling of the hold when the cargo settles down.

In place of removed 'tweendeck planks, the 'tweendeck must be secured by coils on the top of the beams.

#### IX.

Materials for the construction of the dunnage and bulkheads must be of good quality and perfectly dry. All unsound knots must be covered.

#### X.

The Inspector must see that the grain is well trimmed up between the beams and the space between them completely filled.

#### B

##### Loading all bags.

#### I.

Vessels being loaded with grain in bags must observe the same rules as specified in A, I and II for vessels loading grain in bulk or part bulk and part bags, with the exception of closing scuppers. The dunnage in the hold must have the same height on the floor and on the bilges as for bulk cargoes and four inches on the sides up to the beams, either clapboarded from deck to keelson or entirely covered with sails, so as to prevent any loose grain from running down to the floor of the vessel. If sails are used, they must be of good quality and free from holes.

'Tweendecks must be dunnaged three inches from the sides and two inches from the deck and the dunnage laid athwartships, so that the water can run to the scuppers.

#### II.

##### SHIFTING BOARDS.

A longitudinal bulkhead or shifting boards *amidships* as specified in A V must extend six feet from the beams downward in the hold and 'tweendecks, and may be set four inches apart.

#### III.

##### QUALITY OF BAGS.

Care must be taken that the bags, especially those which are stowed in the ground tier or next to the sides of the vessel, are in

perfect order and that the seams of the bags are inside when stowed against the sides of the vessel, so as to prevent any loose grain from falling down the sides of the vessel. The tiers are to be laid close and well filled.

## GENERAL CONDITIONS

### I.

#### DRAUGHT OF WATER.

The draught of water of wooden vessels to be regulated by three inches clear side for every foot depth of hold, or at the discretion of the Inspector measured from the under side of the deck at the lowest part of the sheer to the water's edge amidships when upright.

In wooden vessels having an additional deck put on after construction, or having a light upper deck, the depth of hold to be measured for draught from original or main deck. For iron vessels the draught of water to be regulated by the Inspector.

### II.

Before receiving cargo, it is requested to see if the deck and opsides of the vessels are in good condition.

### III.

Flat floored wall sided ships should be fitted with bilge pumps.

January 1880.

R. ULRICH,  
Secretary General of the International  
Underwriters' Association.

# LLOYD'S COMMERCIAL SIGNALLING AND SEMAPHORES.

---

The Society of Lloyd's, incorporated by Act of the British Parliament and the Royal Assent of Her late Majesty Queen Victoria, has, with the sanction of Parliament, the control and working of Signal Stations in Great Britain and Ireland and in various places abroad. Many foreign Governments have also recognised the advantage of reports from Signal Stations and Semaphores being universally collected and forwarded on identical conditions. These have arranged that reports from or to their Semaphores can be obtained or forwarded through Lloyd's.

Thus one universal system of receiving and transmitting reports extends over a wide area. The organisation of Signal Stations is made favourable for shipowners and merchants, and the commerce of the world in general. If, for instance, a shipowner, charterer, or consignee, wishes to transmit an order to any vessel at any point where she may appear, one communication to Lloyd's is sufficient to ensure the message being given at any or all of these Stations.

The charges for forwarding information from, or transmitting advices by means of, Signal Stations are moderate. Shipowners, charterers, merchants, or consignees can obtain telegraphic intelligence with regard to any vessel in which they may be interested, or postal advices, if so preferred, or can transmit orders to such vessels by communication with Lloyd's.

Harbour and Dock authorities, Chambers of Commerce, Exchanges and such Institutions that may require a large number of reports, can arrange with Lloyd's for receiving full and regular advices

from Lloyd's Signal Stations on moderate terms. When a number of reports are taken, a substantial reduction is made in the fees.

Shipowners or others who wish to be supplied with reports of vessels from any Signal Stations are requested to communicate with the Secretary of Lloyd's, London, E. C.

The following is a list of Signal Stations from which reports can be obtained or through which orders for vessels can be transmitted:—

## UNITED KINGDOM.

---

SOUTHEND (A).

DEAL (Temporarily suspended) (A).

\*† DOVER (L).

SANDGATE (A).

DUNGESS (A).

BEACHY HEAD (A).

\*† NOMAN'S FORT (SPITHEAD) (S).

ST. CATHERINE'S POINT (I. W.) (L).

NEEDLES (I. W.) (A).

PORTLAND BILL (L).

BRIXHAM (FOR TORBAY) (Temporarily suspended) (A).

\*† PRAWLE POINT, (L)

\*† THE LIZARD (L).

PENZANCE (S).

SCILLY ISLANDS (L).  
LUNDY ISLAND (L).  
± BARRY ISLAND (A).  
MUMBLES LIGHTHOUSE. Orders can also be delivered from the  
Mumbles Pier (S).  
ST. ANNE'S HEAD (MILFORD HAVEN) (A).  
ROCHE'S POINT. (L).  
\*† OLD HEAD OF KINSALE (L).  
\*† FASTNET (Wireless Telegraphy—Marconi System) (S).  
\*† BROW HEAD (Wireless Telegraphy—Marconi System) (L).  
TORY ISLAND (L).  
\*† INISHTRAHULL (Wireless Telegraphy—Marconi System) (L).  
MALIN HEAD (Wireless Telegraphy—Marconi System) (L).  
RATHLIN ISLAND (Temporarily suspended) (L).  
TORR HEAD (A).  
KILDONAN (MOUTH OF THE CLYDE) (L).  
LAMLASH (Temporarily suspended) (A).  
BUTT OF LEWIS (HEBRIDES) (L).  
DUNNET HEAD (PENTLAND FIRTH) (L).  
PETERHEAD (Temporarily suspended) (A).  
ST. ABB'S HEAD (L).  
(s) TYNEMOUTH (L).  
RIVER TEES (SOUTH GARE BREAKWATER) (Temporarily sus-  
pended) (S).  
FLAMBOROUGH HEAD (A).  
SPURN HEAD (L).  
ALDEBURGH (A).

± This Station has also been connected by telephone with the Telephone  
Exchanges at Cardiff. Subscribers to the Telephone Exchanges in Barry  
and Cardiff can obtain telephonic reports without cost, excepting the  
ordinary fee for reporting.

(s) This Station is connected by telephone with the Post Office Telephone  
Exchange at North Shields.

(L) Stations belonging to Lloyd's.

(A) Stations belonging to the Lords Commissioners of the Admiralty,  
but signalling is conducted at them on behalf of Lloyd's.

(S) At these Stations special arrangements have been made for signal-  
ling being conducted for Lloyd's.

\* At these Stations arrangements have been made for night-watch to  
be kept in order to take in pyrotechnic night signals made by passing  
vessels whose owners have such private night signals registered by the  
Board of Trade. The signal to intimate that a vessel's pyrotechnic night  
signal has been seen and recognised is a red flare light of 30 seconds  
duration.

† At these Stations arrangements have also been made to take in, in  
addition to the above pyrotechnic night signals, any messages made at  
night by means of a flashing lamp in accordance with the Morse code.  
Messages may be transmitted from these Stations to vessels by flashing  
lamp in the same manner. The signal to call the attention of a vessel or  
Signal Station at night is a series of continuous short flashes made by a  
flashing lamp. The signal to intimate that signals have been seen and  
recognised is a series of long and short flashes repeated as often as may  
be necessary. If the signal shown by the vessel has not been understood,  
the lamp is kept dark until the vessel repeats her signals.

## ABROAD.

### EUROPE (West Coast) Hdn.

RAT ISLAND		
TURK'S ISLAND (Lloyd's).		
BERMUDA (Gibb's Hill).		

# ST. LAWRENCE.

The following Signal Stations are maintained by the Government of Canada. Orders forwarded to Lloyd's can be transmitted to vessels by means of these Signal Stations on the same conditions as through Lloyd's Signal Stations. Vessels signalling to these Signal Stations will be reported to Lloyd's in the same manner as if they signalled from Lloyd's Signal Stations :

BELLE ISLE (LABRADOR).	
CAPE RACE (NEWFOUNDLAND).	
CAPE RAY (NEWFOUNDLAND).	
ST. PAUL'S ISLAND	} CAPE BRETON.
CAPE ST. LAWRENCE	
HEATH POINT	} ANTICOSTI.
SOUTH POINT	
SOUTH-WEST POINT	
WEST POINT	
CAPE ROSIER	} CANADA.
FAME POINT	
CAPE MAGDALEN	
AMHERST ISLAND (MAGDALEN ISLANDS).	

\* At these Stations arrangements have been made to take pyrotechnic night signals.

† At these Stations arrangements have also been made to take in, in

addition to the above pyrotechnic night signals, any messages made at night by means of a flashing lamp in accordance with the Morse code. Messages may be transmitted from these Stations to vessels by flashing lamp in the same manner. The signal to call the attention of a vessel or Signal Station at night is a series of continuous short flashes made by a flashing lamp. The signal to intimate that signals have been seen and recognised is a series of long and short flashes repeated as often as may be necessary. If the signal shown by the vessel has not been understood, the lamp is kept dark until the vessel repeats her signals. Steamers wishing to signal at night to Gibraltar by means of the Morse code are reminded that the vessel must be sufficiently near the Station to enable the Morse signals to be read correctly.

An arrangement has been concluded with the Marconi Wireless Telegraph and International Marine Communication Companies, by which all maritime intelligence received by Wireless Telegraphy at any Station worked by either of these Companies, including Poldhu and similar Stations primarily used for shore-to-shore or overland telegraphy, shall forthwith be communicated to Lloyd's. Masters of vessels equipped with this apparatus are accordingly requested to forward to the nearest Wireless Telegraph Station any maritime intelligence—*e.g.*, wrecks, speakings, derelicts, casualties, vessels in distress, &c., with a view to its being forthwith communicated to Lloyd's. No charge for sea transmission will be made against vessels for such messages. Therefore Masters of vessels are requested to communicate such intelligence as freely as possible.

The following Stations in the United Kingdom are fitted with the Marconi Wireless Telegraphic apparatus :

NORTH FORELAND.  
FASTNET ROCK.  
NITON.  
BROW HEAD.

LIZARD.  
MALIN HEAD,  
ROSSLARE.  
INISHTRAHULL.

Lloyd's Stations at Pord Said and Port Tewfik are also equipped.

*Vessels in distress have the right to communicate by means of Wireless Telegraphy with any Lloyd's Station or with any Station worked by the Marconi Companies, irrespective of the wireless system with which the vessels may be equipped.*

Lloyd's is exclusively entitled to the benefits and profits of all maritime signalling worked by the Marconi system in all countries, with a few special exceptions.

#### STATIONS CLOSED.

Two Black Balls hoisted horizontally at the head of the Signal Staff indicates that the Signal Station is temporarily *closed*, and that no communication can be held.

#### TELEGRAPHIC COMMUNICATION INTERRUPTED.

Three Black Balls hoisted as a triangle at the head of the Signal Staff indicates that telegraphic communication is *interrupted*, and that messages cannot be forwarded by telegraph, but will be forwarded by other means as soon as possible.

To denote telegraphic interruption at night time, the Signal Station at the Old Head of Kinsale will show Three Green Lamps arranged in the form of a triangle with apex upwards; and to call attention to this signal a Roman Candle will be burnt if the vessel can be recognised.

## GALES.

The Meteorological Office sends to the Signal Stations at St. Catherine's Point, Noman's Fort, Prawle Point, the Lizard, Lundy Island, Flamborough Head, St. Abb's Head, Dunnet Head, Malin Head, Brow Head, and Old Head of Kinsale telegrams announcing atmospheric disturbances near the Coasts of British Islands. The fact that one of these notices has been received at any Station is made known by hoisting a Cone three feet high and three feet wide at base, which appears as a triangle when hoisted. The cone is kept hoisted until

dusk, and then lowered, but is hoisted again at daylight next morning.

SOUTHERLY GALE. — The SOUTH CONE (*point downwards*) is hoisted for Gales and Strong Winds from S.E., veering to S.W., W. or N.W.; from S.W., veering to W. or N.W.; from W., veering to N.W.; and also from E., veering to S. or S.W.

NORTHERLY GALE. — The NORTH CONE (*point upwards*) is hoisted for Gales and Strong Winds from S.E., E or N.E. backing to N.; from N.W., veering to N., N.E. or E.; from N., veering to N.E. or E.; from N.E., veering to E.

Licata (Sicily). . . . . Angelo Verderame di Matteo.  
Cable Address—Averderame, Licata.

Linwood (New Jersey, U. S. A.) . . . . Mark Townsend.

Lisbon (Portugal). . . . . James Rawes & Co.  
Cable Address—Rawes, Lisbon.

Liverpool (England) . . . . .

London (England) . . . . . William Arnold.  
Cable Address—Wendt, London.

Los Angeles (California, U. S. A.) . . . . .

Lubec (Maine U. S. A.) . . . . . C.-J. Staples.

Macassar (Island of Celebes) . . . . . J. Mohrmann & Co.  
Cable Address—Mohrmann, Macassar.

Madras (British India, Asia) . . . . . Wilson & Co.  
Cable Address—Wilson, Madras.

Malaga (Spain). . . . . Francisco Reyes.  
Cable Address—Reyes, Malaga.

Malta . . . . . O.-F. Gollcher & Sara.  
 Manasquan (New Jersey, U. S. A.) . . . Howard Osborn.  
 Manila (Philippine Islands) . . . . . Macleod & C<sup>o</sup>.  
     Cable Address—Macleod, Manila.  
 Manteo (North Carolina, U. S. A.) . . . Theodore S. Meekins.  
 Manzanilla (Cuba) . . . . .  
 Manzanillo (Mexico) . . . . .  
 Maracaibo (Venezuela, S. A.) . . . . . Ernst Wust.  
     Cable Address—Wust, Maracaibo.  
 Maranhao (Brazil, S. A.) . . . . . Custodio G. Belchoir.  
     Cable Address—Belchoir, Maranhao.  
 Maroim (Brazil, S. A.) (Port Aracaju) . . Luis Schmidt.  
     Cable Address—Schmidt, Aracaju.  
 Marseilles (France) . . . . .  
     Cable Address— . . . . , Marseilles.  
 Mathewtown (Inagua, W. I.) . . . . . Daniel D. Sargent.  
     Cable Address—Sargent, Cape Haiti.  
 Maulmain (British India, Asia) . . . . . Bulloch Bros. & C<sup>o</sup>.  
     Cable Address—Bullochs, Maulmain.  
 Mayaguez (Porto Rico, W. I.) . . . . . Ad. Koester  
 Mazatlan (Mexico) . . . . .  
 Medellin (Rep. of Colombia) . . . . . William Gordon.  
 Melbourne (Australia) . . . . . W. Forster Woods.  
     Cable Address—Policy, Melbourne.  
 Merida and Progreso (Mexico) . . . . . Arthur Peirce.  
     Cable Address—Peirce, Merida.

Mersine and Adana (Turkey) . . . . . Max Brazzafolli.  
     Cable Address—Brazzafolli, Mersine).  
 Messina (Italy) . . . . .  
     Cable Address— . . . . , Messina.  
 Mobile (Alabama, U. S. A.) . . . . . Lloyd D. Batre.  
 Montauk Point (Suffolk C<sup>o</sup>, New-York,  
     U. S. A.) . . . . . Frank S. Stratton.  
     Address—East Hampton.  
 Montevideo (Uruguay, S. A.) . . . . . Ernest O. Crocker.  
     Cable Address—Carlises, Montevideo.  
 Montreal (Canada) . . . . .  
 Montserrat and Redondo (Windward Isl.) . . . .  
 Mozambique (South Africa) . . . . .  
 Nagasaki (Japan) . . . . . Holme Ringer & C<sup>o</sup>.  
 Nantes (France) . . . . . Adolphe Bare.  
     Cable Address—Adolphe Bare, Nantes.  
 Nantucket (Massachusetts, U. S. A.) . . . John Killen.  
 Napier, North Island (New Zealand) . . . Fraser & Bull.  
     Cable Address—Bull, Napier.  
 Naples (Italy) . . . . . Kellner & Lampe.  
 Nassau (New Providence, Bahama) . . . Lewis Taylor.  
     Cable Address—Sauver, Nassau.  
 Natal (Brazil) . . . . .  
 New Bedford (Massachusetts, U. S. A.) . . Samuel H. Cook.  
 New Castle (Australia) . . . . . Arthur Selwyn Wallace.  
     Cable Address—Wallace, Newcastle.

New Haven (Connecticut, U. S. A.). . . H. Mason.  
 New London (Connecticut, U. S. A.). . . Thomas Edgar.  
 New Orleans (Louisiana, U. S. A.). . . Walter J. Ferguson.  
 New Shoreham (Block Island, Rhode  
 Island, U. S. A.) . . . . . Uriah B. Dodge.  
 Norfolk (Virginia, U. S. A.) . . . . . William Lauder.  
 North Sydney (Nova Scotia, Canada). . . Archibald & Co.  
 North Truro (Massachusetts, U. S. A.). . John G. Thompson.  
 Noumea (New Caledonia). . . . . A. Buso.  
 Cable Address—Buso, Noumea.  
 Nuevitas (Cuba) . . . . . John F. Hanson.  
 Cable Address—Hans, Nuevitas.

Ocean City (Maryland, U. S. A.). . . . James H. Mumford.  
 Ocean Grove (New Jersey, U. S. A.). . . John M. Dey.  
 Odense (Denmark) . . . . . Chr. Clemmensen.  
 Cable Address—Clemmensen, Odense.  
 Odessa (Russia). . . . . John Pitts.  
 Cable Address—Pitts, Odessa.  
 Old Providence Island (Republic of  
 Colombia) . . . . .  
 Oporto (Portugal). . . . . J.-W. Burmester.  
 Cable Address—Burmester, Oporto.  
 Oran (Algeria) . . . . . Ch. Julian.  
 Cable Address—Julian, Oran.  
 Orleans (Massachusetts) . . . . . E. L. Snow.  
 Ostend (Belgium). . . . . William Neuts.  
 Cable Address—Neuts, Ostend.

Padang (Sumatra, East Indies). . . . . Haacke & Co.  
 Cable Address—Haacke, Padang.  
 Pago Pago, Tutuila, Samoa (Friendly  
 and Navigators Islands) . . . . . W. Blacklock.  
 Cable Address—Blacklock, Pagopago, via Auckland.  
 Palermo (Sicily, Italy) . . . . . Angelo Tagliavia.  
 Cable Address—Angelo, Palermo.  
 Panama (Republic of Panama, S. A.). . . Frederick Boyd.  
 Cable Address—Boyd, Panama.  
 Para (Brazil, S. A.). . . . . R. O. Ahlers & Co.  
 Cable Address—Kanthack, Para.  
 Paramaribo (Dutch Guiana, S. A.). . . . .  
 Cable Address—....., Surinam.  
 Paranagua (Brazil) . . . . .  
 Patchogue (Suffolk Co, New York, U.S.A.) . Charles E. Rose.  
 Patras (Greece) . . . . .  
 Payta (Peru) . . . . .  
 Penang (Malaya, Straits Settlements) . . Huttenbach, Liebert & Co.  
 Cable Address—Huttlieb, Penang.  
 Pensacola (Florida, U. S. A.). . . . . L. Le Baron.  
 Pernambuco (Brazil, S. A.). . . . . Henry Forster & Co.  
 Cable Address—Forster, Pernambuco.  
 Philadelphia (Pennsylvania, U. S. A.). . Capt J. F. Fisher.  
 Pictou (Nova Scotia, Canada) . . . . . Charles W. Ives.  
 Piraeus (Greece) . . . . . Manussi & Gialistra.  
 Cable Address—Securitas, Piraeus.  
 Plymouth (England). . . . . Fox, Sons & Co.  
 Cable Address—Fox, Plymouth.  
 Plymouth (Massachusetts, U. S. A.). . . Edward B. Atwood.

Point de Galle (Ceylon). . . . . Edward Coates.  
Cable Address—Devonia, Galle.

Point Pleasant (New Jersey, U. S. A.) . . Charles W. Maxson.

Pointe à Pitre (Guadeloupe, W. I.) . . J.-E. De Vaux.  
Cable Address—Vaux, Guadeloupe.

Ponce (Porto Rico) . . . . . Fritze, Lundt & C<sup>o</sup>, Sucs.  
Cable Address—Unfritze, Portorico.

Portaleza (Brazil) . . . . .

Port Arthur (Texas, U. S. A.) . . . . R.-D. Steele

Port au Prince (Haiti, W. I.) . . . . Edward Cutts.  
Cable Address—Cutts, Portauprince.

Port Dennison (Australia) . . . . .

Port Jefferson (Suffolk C<sup>o</sup>, New York,  
U. S. A.). . . . . C.-A. Bayles.

Portland (England). . . . . Fox, Sons & C<sup>o</sup>.  
Cable Address—Fox, Portland.

Portland (Maine, U. S. A.). . . . . William Leavitt.

Portland (Oregon, U. S. A.) . . . . . Henry Hewett.

Port Limon (Costa Rica) . . . . . John M. Keith.

Port Louis (Mauritius). . . . . Scott & C<sup>o</sup>.  
Cable Address—Scottein, Mauritius.

Port Natal (South Africa) . . . . . Wm. Dunn & C<sup>o</sup>.  
Cable Address—Dunn, Port Natal.

Port of Spain (Trinidad). . . . . W. Stedmon Archer.  
Cable Address—Archer, Trinidad.

Port Said and Suez (Egypt). . . . . Wills & C<sup>o</sup>.  
Cable Address—Lichtenburg, Port Said.

Portsmouth (New Hampshire, U. S. A.). . John Sise & C<sup>o</sup>.

Port-Sudan (Red Sea) . . . . . Weber & C<sup>o</sup>.

Providence and Newport (Rhode Island,  
U. S. A.) . . . . .

Provincetown (Massachusetts, U.S.A.) . . Angus Mc Kay.

Puerto Cabello (Venezuela) . . . . . Rivas, Fensohn & C<sup>o</sup>.  
Cable Address—Rivenson, Porto Cabello.

Puerto Cortes (Honduras) . . . . . C.-J. Warren et C<sup>o</sup>.  
Cable Address—Warren, Honduras.

Puerto Plata (Santo-Domingo) . . . . E. Heinsen.  
Cable Address—Heinsen, Portoplata.

Punta Arenas (Terre del Fuego) . . . . Wm Perkins.  
Cable Address—Braun, Punta-Arenas.

Punta Arenas (Costa-Rica). . . . . Charles D. Scott.  
Cable Address—Scott, San-Jose.

Punta Gorda (Florida, U. S. A.) . . . . K.-B. Harvey.

Quebec (Canada). . . . .

Queenstown (Ireland) . . . . . James Scott & C<sup>o</sup>.  
Cable Address—Scott, Queenstown.

Rangoon (British India, Asia) . . . . . Gillanders, Arbuthnot & C<sup>o</sup>.  
Cable Address—Gillanders, Rangoon.

Reval (Russia) . . . . . C.-R. Cattley.  
Cable Address—Cattley, Reval.

Riga (Russia). . . . . P. Bornholdt & C<sup>o</sup>.  
Cable Address—Bornholdt, Riga.

Rio-de-Janeiro (Brazil, S. A.). . . . . W.-C. Peck.  
Cable Address—Peck, Rio.

Rio Grande do Sul (Brazil). . . . . Albert Lorentzen,  
Cable Address—Gerdo, Rio-Grande.

Rio Hacha (Republic of Colombia). . . . .

Rosario de Santa Fé (Argentine Republic, S. A.) . . . . . D.-O. Le Bas.  
Cable Address—Lebas, Rosario.

Rosseau (Dominica) . . . . .  
Rotterdam (Holland). . . . . Wambersie & Son.  
Cable Address—Wambersie, Rotterdam.

Sagua la Grande (Cuba, W. I.). . . . . John F. Jova.  
Cable Address—Jova, Sagua la Grande.

Saigon (Cochin-China) . . . . . Wm. G. Hale & Co.  
Cable Address—Hale, Saigon.

St. Augustine (Florida, U. S. A.) . . . William W. Dewhurst.

St. Denis (Reunion) . . . . .

Saint Georges (Grenada, W. I.) . . . . A. Hubbard & Co.  
Cable Address—Hubbard, Grenada.

Saint John (New Brunswick). . . . . Vroom & Arnold.

Saint Johns (Antigua, Windward Isl.). Geo. W. Bennett, Bryson  
& Co.

Cable Address—Bennett, Antigua.

Saint Johns (Newfoundland). . . . . Harvey & Co.

St. Kitts or St. Christopher (Windward Islands). . . . . Emile S. Delisle.  
Cable Address—Delisle, St. Kitts.

Saint Louis (Missouri) . . . . . Charles H. Campfield.

Saint Marks (Florida, U. S. A.) . . . . .

Saint Michaels (Azores) . . . . . W.-W. Nicholls.  
Cable Address—Nicholls, Pontadelgada.

St. Paul de Loando (Lower Guinea). . . . .

St. Petersburg and Cronstadt (Russia). Ernest Dollar.  
Cable Address—Dollar, St. Petersburg.

Saint Pierre (Miquelon Islands) . . . . Newhall & Henderson Co.

Saint Thomas (Virgin Islands, W. I.) . Joseph Ridgway, Jr.  
Cable Address—Ridgway, St. Thomas.

Saint Vincent (Cape Verde Islands) . . . . .

Salonica (Turkey). . . . . J. Nehama & Co.  
Cable Address—Jacques Nehama, Salonica.

Samana (Santo Domingo). . . . .

Samarang (Java, E. I.). . . . . Mirandolle, Voute & Co.  
Cable Address—Mataram, Samarang.

San Andres Island . . . . .

San Blas (Mexico) . . . . .

San Diego (California, U. S. A.). . . . Charles H. Davis.

San Domingo City (Santo Domingo) . L. Pardo.  
Cable Address—Pardo, San Domingo.

San Francisco (California, U. S. A.). . J.-R. Helen.

San José de Guatemala (Central America). . . . . F.-E. Köper.  
Cable Address—Koper, Guatemala.

San Juan Bautista (Mexico) . . . . .

San Juan del Sur (Nicaragua, Central America) . . . . . Chas. Holmann.  
Cable Address—Holmann, San Juan del Sur.

San Juan de Porto Rico (Porto Rico, W. I.). . . . . Mullenhoff & Korber.  
Cable Address—Korber, Portorico.

San Pedro de Macoris (Santo Domingo, W. I.). . . . . Friedheim & Clasing, Acting.  
Cable Address—Ehlfried, Macoris.

San Salvador (Central America) . . . . Herbert de Sola.  
Cable Address—Desola, San Salvador.

Santa Cruz (Flores, Azores) . . . . . James Mackay.  
Cable Address—Mackay, Flores.

Santa Cruz (Teneriffe, Canary Islands). Hamilton & Co.  
Cable Address—Hamilton, Teneriffe.

Santa Cruz or St. Croix (Virgin Isl., W. I.) A.-J. Blackwood.  
Cable Address—Blackwood, St. Croix.

Santander (Spain) . . . . . Carlos Hoppe & Co.  
Cable Address—Hoppe, Santander.

Santiago de Cuba (W. I.). . . . . R. Scott Douglas.  
Cable Address—Douglas, Santiago de Cuba.

Santos (Brazil, South America) . . . . Charles E. Demarest.  
Cable Address—Demarest, Santos.

Savanna la Mar (Jamaica, W. I.) . . . Leyden & Co.  
Cable Address—Leyden, Savanna La Mar.

Savannah (Georgia U. S. A.). . . . . A.-L. Farie.

Scilly Islands (England) . . . . . Banfield & Hooper.  
Cable Address—Banfield, Scilly.

Seaford (Nassau C<sup>o</sup>) . . . . . David Waring.

Seaville (New Jersey) . . . . .

Sebastopol (Russia) . . . . .

Sevilla (Spain). . . . . Dunipe & Co.  
Cable Address—Dunipe, Sevilla.

Shanghai (China). . . . . Frazar & C<sup>o</sup>.  
Cable Address—Frazar, Shanghai.

Sierra Leone (Senegambia, Africa) . . . Philip Davey.  
Cable Address—Davey, Sierra Leone.

Singapore (Straits Settlements). . . . Behn, Meyer & C<sup>o</sup> L<sup>d</sup>.  
Cable Address—Behn, Singapore.

Smyrna (Turkey) . . . . . Alexander Datody.  
Cable Address—Datody, Smyrna.

Soerabaya (Java, E. I.). . . . . Mirandolle, Voute & C<sup>o</sup>.  
Cable Address—Mataram, Soerabaya.

Souirah (Morocco) . . . . .

Stanley (Falkland Islands). . . . . W.-A. Harding.  
Cable Address—Fleetwing, Montevideo, or Fleetwing)  
Punta-Arenas.

Stettin and Swinemunde (Germany). . . Fr. Pitzschky.  
Cable Address—Pitzschky, Stettin.

Stockholm (Sweden) . . . . . Olsen & Wright, Limited.  
Cable Address—Wright, Stockholm.

Stonington (Connecticut, U. S. A.) . . . Moses A. Pendleton.

Stornoway (Scotland). . . . .

Stralsund (Germany) . . . . .

Sunderland (England) . . . . .

Sydney (New South Wales, Australia) . . J. Vine Hall.  
Cable Address—Vinehall, Sydney.

Syra (Greece). . . . .

Tacoma (Washington) . . . . . J.-B. Clift.

Tahiti (Society Islands) . . . . .

Talcahuano (Chili, S. A.). . . . . Edward Hyde.  
Cable Address—Hyde, Talcahuano.

Tamatave (Madagascar) . . . . .

Tampa (Florida, U. S. A.) . . . . . M.-W. Carruth.

Tampico (Mexico) . . . . . Nicolas del Campo.

Tamsui, Formosa (China). . . . .  
Cable Address — Gowland, Tamsui.

Tehuantepec (Mexico) . . . . .

Trieste (Austria-Hungary) . . . . . Edward H. Greenham.  
Cable Address—Richgreen, Trieste.

Tripoli (Africa). . . . . Gioacchino Galea.  
Cable Address—Galea, Tripoli.

Trebizond (Turkey). . . . .

Truxillo (Honduras) . . . . .

Tunis (Africa). . . . . G. Attia  
Cable Address—Attia, Assurances, Tunis.

Tuxpan (Mexico) . . . . . Angelo Echeverria.

Valencia (Spain) . . . . . John D. Arguimbau.  
Cable Address—Arguimbau, Valencia.

Valparaiso (Chili, South America) . . . Compton & Co.  
Cable Address—Compton, Valparaiso.

Vancouver (British Columbia) . . . . H.-A. Mellon.

Venice (Italy) . . . . .

Vera Cruz (Mexico) . . . . . Viya Hermanos Sucesores.

Vieques for the Island (Porto-Rico, W.I.). . . . .  
Cable Address— . . . . , Vieques.

Vineyard Haven (Massachusetts, U.S.A.) Edward C. Lord.

Wellington, North Island (New Zealand) A.-S. Paterson & Co.  
Cable Address—Pasantia, Wellington.

Wilmington (North Carolina, U. S. A.) John Wilder Atkinson.

Wisby (Sweden) . . . . . Axel Ekman.  
Cable Address—Axel Ekman, Wisby.

Wyk (Germany) . . . . .

Yarmouth (Nova Scotia, Canada) . . . Bowan B. Law.

Yokohama & Kobe (Japan) . . . . . Sale & Frazar Ltd.  
Cable Address—Frazar, Yokohama & Kobe.

Zanzibar (South-Africa) . . . . .

# CLASSIFICATION OF WOODEN VESSELS

## ARTICLE 1.

§ 1. — The estimate of the qualities and defects of wooden vessels is expressed by the fractions:  $3/3$ ,  $5/6$ ,  $3/4$ ,  $2/3$ ,  $1/2$ , which are characters established in conformity with the Rules for the building and survey. (*See Art. 2 and following.*)

§ 2. — The character is completed by two numbers which vary from 1 to 3, and follow the fraction; these numbers indicate separately the state or quality of the hull and of the outfit; the number on the left hand (placed in the Register and Certificates after the vessel's character and navigation mark) having reference to the hull; that on the right hand, to the rigging, sails, anchors, chains, &c.

The characters are consequently represented in the following way:

$3/3$ . 1.1.

$5/6$ . 1.1.

$5/6$ . \*2.1.

$3/4$ . 2.1.

$2/3$ . 3.2.

$1/2$ . 3.2.

## ARTICLE 2.

§ 1. — The first character ( $3/3$ , 1.1.) is given to vessels which have not passed the maximum term established by articles 7, 11, 12 and 13 and are found to be well built and in good condition of repairs and preservation.

The succeeding characters are given in accordance with the conditions specified in Articles 14 and 18 of the Regulations.

In the Register the character (3/3, 5/6...) is preceded by a number (3 to 16) which expresses the « Division » or « Type » the vessel belongs to, according to her construction.

This number is regulated by the class of timber (Table B) and by the additional years granted by Art. 7.

If two numbers precede the character, the first indicates the type of the vessel, the second expresses the term assigned to the character, dating from the day the certificate was issued.

**12-10** signifies the vessel belongs to 12 years type and is classed for 10 years.

§ 2. — The characters and the rates (3 to 16) are granted to all vessels which fulfil the conditions of survey and construction required by Articles 5, and 20 to 27 of the Rules, or to those which are equally efficient, as stated in Article 28.

§ 3. — Vessels retain their character in the Register on condition of being submitted to the surveys required by Art. 6.

§ 4. — A prolongation of character may be granted to vessels which have been submitted to one of the surveys prescribed by Art. 11 to 18 of the Rules.

§ 5. — The Administration reduces the rate, according to the report of the Surveyor, by a number of years for

vessels which come under the application of Art. 9, also for those which do not fulfil the requirements of the Rules for building.

### ARTICLE 3.

§ 1. — Wooden vessels are classed for one of the following trades

1° *I. (Interior)*. Vessels especially built to navigate canals, lakes and rivers.

2° *R. (Roadstead)*. Vessels specially intended for roadstead work. This mark R is also used exclusively for dredgers, hopper barges and the like.

3° *P. (Small coasting trade)*. Vessels intended for short voyages.

4° *M. (Mediterranean)*. Vessels specially intended for the navigation in the Mediterranean sea.

5° *Y. (Yachting)*. Vessels intended for pleasure sailing.

6° *R. (Rating)*. Sailing Yachts intended for the International Rating Certificate.

7° *G. (Great coasting trade)*. Vessels, with single bottom or wood sheathed, above 70 tons gross tonnage, and not provided with the inventory required for higher marks of navigation, will be classed for this trade.

8° *LAKES*. — Vessels specially intended for service in large fresh water lakes, and more particularly those of North America.

9° A. (*Atlantic trade*). Navigation not beyond Cape Horn and Cape of Good Hope, on either side.

For this trade a ship must be above 100 tons gross tonnage, and copper, yellow metal or zinc sheathed up to a draught of water equal to half the depth of hold at midship.

In spardecked vessels, the height of sheathing shall be increased by  $\frac{1}{5}$  of the height of the 'tweendeck.

10° L. (*Long voyages*). Trade round the world in all seas.

This letter can only be given to vessels of and above 250 tons gross tonnage, and copper or yellow metal sheathed (zinc being excluded) up to a distance from the deck equal to  $\frac{1}{3}$  of the depth of hold amidship.

In spardecked vessels, the height of sheathing shall be increased by  $\frac{1}{5}$  of the height of 'tweendeck.

When boot topped, the metal must extend up to a distance from the deck at least equal to half the depth of hold amidship.

§ 2. — For all these trades vessels must have a pumpwell accessible from the upper deck, and a complete inventory as required by Art. 27.

§ 3. — For the classification and construction of Sailing Yachts classed  $\mathfrak{R}$  the special Rules published by the Administration of the Bureau Veritas are to be followed.

For steam or motor yachts, and for yachts excee-

ding the dimensions contemplated by the special Rules, and which will not receive the special rating mark  $\mathfrak{R}$ , the following reductions in scantlings will be admitted.

All the scantlings, except those of the outside planking and the spacing of frames, are to be taken from Tables A, but one grade lower than given by the actual numeral. For the outside planking three grades lower may be taken. The frame spacing may be increased by 20 %.

#### ARTICLE 4.

§ 1. — To obtain a class, written application must be made to the Surveyor; this demand implies that the parties are willing to abide by the Rules.

§ 2. — At the expiration of the character, the vessel may be retained in the Register without a class.

§ 3. — It is understood, that no action at law can be entered against the Administration for the maintenance in the Register of the vessel's name, when the character has expired.

#### ARTICLE 5.

##### BUILDING OF VESSELS

§ 1. — The specification should be sent in with the application for survey and submitted to the Administration for approval. The Surveyor must examine the

vessel whilst building and during the fitting out. He will arrange his surveys so as to be able to obtain a correct knowledge of the scantlings and quality of the materials, also of the sizes and arrangements of the fastenings, &c., as well as of the quality of the workmanship.

§ 2. — When application has been made for *special survey*, the Surveyor will superintend the building as often as possible during its entire progress.

§ 3. — The Surveyor must inform the interested parties of the defects he may observe during his inspection, and indicate the requirements of the Rules, without involving the responsibility of the Veritas as to the losses which might result therefrom. He must transmit to the Administration a full statement of the scantlings, dimensions, fastenings, quality of the materials, &c. and of the merits or defects of construction.

§ 4. — Vessels built under special survey will be inserted in the Register with the distinctive mark ✕.

To obtain the said mark, vessels must have their anchors and chains tested and certified as per Art. 27 § 6.

## ARTICLE 6.

### PERIODICAL SURVEYS.

§ 1. — In order to be maintained on the character which has been assigned, the vessel must be submitted

to the periodical examination of the Surveyors of the Administration at least *once in every two years*; the vessel must also be submitted at the prescribed time to the survey required by Article 10, according to the division to which she belongs.

§ 2. — At the periodical inspections, the Surveyors must ascertain the vessel's state of seaworthiness and the condition of the materials, and determine whether it be necessary to remove strakes of ceiling or outside planking, in order to examine the timbers.

If four years maximum have elapsed since the bottom was caulked, the butts, garboard seams, bilges and wood ends to be well examined and tried.

At this time the Surveyor shall require the bottom to be caulked if necessary. But if in his opinion the recaulking may be postponed, he shall fix a date (not exceeding two years) within which the recaulking has to take place, and a note to this effect shall be put on the certificate and survey report.

§ 3. — The Surveyor must be called in when the sheathing is removed or renewed, and when the vessel is undergoing repairs, in order to survey and report on them, and endorse the certificate of classification.

§ 4. — The Surveyors are to have free access at all times to examine the vessels classed in the Veritas Register, in order to ascertain their condition.

§ 5. — In case of want of repairs, the Surveyor must give written notice to the master or owner, and the character may be withdrawn unless the repairs are effected.

§ 6. — In case of damage or stranding, the classification having lapsed in consequence of the accident, the owners or their agent must notify the Veritas Surveyor, in order to have the vessel surveyed. This notification must be sent in time to allow the Surveyor to ascertain the nature and extent of the necessary repairs which must be satisfactorily executed under his inspection.

When the repairs have been completed, the Surveyor will endorse the certificate which will then resume its original value.

When the vessel enters a port for repairs not situated in the district of a Veritas Surveyor, a copy of the official survey report must be sent to the Administration, and she is to be afterwards surveyed at the first port where the Bureau Veritas is represented.

When this is not attended to, the class may be withdrawn.

§ 7. — The character may be withdrawn, if the vessel has not been surveyed as required by the Rules.

§ 8. — When the character is withdrawn, notice will be given in the Supplements or in the Register.

§ 9. — Wooden steam vessels shall not be classed

before having their engines and boilers examined and approved by an Engineer Surveyor of the Society.

These vessels receive two certificates: one for the hull and the other for engine and boilers.

#### ARTICLE 7.

§ 1. — The term of years assigned on the 3/3 class to vessels which have been surveyed whilst building, will be determined by the minimum of years granted to the timber used in the construction, agreeably with Table B, and by the additional years as specified in the following §§ 2, 3, 4, provided the vessel fulfils the requirements of Art. 20 to 28.

§ 2. — *Additional years* will be granted in the following cases:

1° *Two years* to vessels built under the special inspection of the Surveyors of the Administration, when the timber used in the construction is entitled by Table B to a minimum term of 8 years;

*One year* when built under the special inspection of the Surveyors of the Administration, with timber of a lower grade;

2° *One year* to vessels built of timber having a maximum rate of 11 years, when salted under the inspection of one of the Surveyors of the Administration during the building, or within six months after launching;

3° *One year* when the bolts and spikes of the outside skin and deck are of galvanized iron, copper or yellow metal;

*Two years* when all bolts and spikes, including frame bolts, ring and eye bolts, chain plates and other iron parts, attached to the hull are galvanized, unless copper or yellow metal;

4° *One year* if timber rated in Table B for 10 or 11 years has been used in vessels, rated otherwise in a lower grade, for the following parts: *Keelsons, Beams and Carlings, Covering-boards, Waterways, Lockstrakes, Spirketting, Clamps, inside bilge strakes, outside binding and channel bolt strakes*. This year will only be granted after approval by the Administration.

The treenails from the covering board down to the lower turn of the bilges to be locust or timber of equal quality.

5° These extensions will be added to the term of years rated in Table B.

§ 3. — Vessels which have not been salted, and which, on special survey, are found to be free from rot, may obtain the additional year granted for the salting.

## ARTICLE 8.

At the expiration of the original term, the character may be continued, or the vessel may obtain an inferior character, according to Articles 11 to 18.

## ARTICLE 9.

### CLASSIFICATIONS.

§ 1.—For vessels built under special survey, see Art. 7.

Before determining the class of a vessel not built under survey of the Administration, the Surveyor must ascertain the vessel's age by an official document, and a full and complete report of her scantlings, bolting, &c., must be forwarded to the Administration. The Surveyor will order the necessary openings to ascertain the kind and quality of the timber used, so as to determine the rate in conformity with Table B.

§ 2. — The Administration will, on receipt of the Surveyor's report, determine the number of years to be deducted from the term allowed by Table B for the timber.

§ 3. — These vessels may have their character extended according to the Rules, care being taken to preserve the above named reduction.

### 3/3 Character.

§ 4. — The 3/3 character will be withdrawn or suspended if the vessel has not been submitted to the survey prescribed by Art. 10, at one of the following periods, according to the type she belongs to:

At the expiration of the *first seven years* of the original term, if belonging to the 14, 15 or 16 years division;

At the expiration of the *first six years* of the original term, if belonging to the 10, 11, 12 or 13 years division.

At the expiration of the *first four years* of the original term, if belonging to a lower division.

§ 5. — After expiration of the original term, the 3/3 character may be continued under the following conditions :

1° For a first continuation of 3 years the vessel must be submitted to the survey prescribed by Article 11.

2° For the continuation,  
of 6 years if rated 12, 13, 14, 15 or 16 years,  
of 5 years if rated 8, 9, 10 or 11 years,  
or of 4 years if of any other rate, the vessel must be submitted to the *Special Survey* prescribed by Article 12.

3° At the expiration of the first continuation of the 3/3 character granted by the 1°, if vessels apply for the further extension they are entitled to according to their division, they shall be submitted to the *Special Survey* prescribed by Article 12, but the Surveyor, if everything was found in a good state of preservation when survey Article 11 was held, will merely complete the openings made for this latter Survey.

**5/6 1.1. Character.**

§ 6. — At the expiration of the 3/3 character or its

continuation, the 5/6, 1. 1. character may be assigned, under the following conditions:

1° For obtaining a first term

of 4 years, if rated 11 years or above,  
and of 3 years, if of a lower rate, the vessel must be submitted to the survey prescribed by Art. 11.

2° For obtaining a first term

of 6 years, if rated 14, 15 or 16 years,  
of 5 years, if rated 11, 12 or 13 years,  
or of 4 years, if of a lower rate, the vessel must be submitted to the *Special Survey* prescribed by Art. 12.

Openings made previously shall in no case be admitted for this survey unless a *special authorisation from the Administration* is obtained.

3° At the expiration of the first term of the 5/6, 1. 1. character granted as above stated, if vessels apply for the further extension they are entitled to according to their division, they shall be submitted either: to the *Special Survey* (Art. 12) if the first term has been obtained after Survey Article 11, or to *Survey* (Art. 11) if the first term has been obtained after special Survey (Art. 12).

The 5/6, 1. 1. character may be further continued in exceptional cases according to the conditions of Art. 15 § 5, and those stipulated in Art. 16.

**5/6 \* 2.1. Character.**

§ 7. — At the expiration of the 5/6, 1.1. character or its continuation, the 5/6 \* 2.1. character may be assigned under the following conditions :

1° For obtaining the first term

of 4 years, if rated 11 years or above,

or of 3 years if of a lower rate, the vessel must be submitted to the survey prescribed by Art. 10.

2° For obtaining a continuation of the 5/6 \* 2.1. character after expiration of the first term above mentioned, the vessel must be submitted to a survey which will be determined by the Administration after a provisional survey of the vessel by the Surveyor.

**3/4 Character.**

§ 8. — At the expiration of the 5/6 \* 2.1. character or its continuation, the 3/4 character may be assigned for *one year*, if the vessel is submitted to the survey prescribed by Art. 10.

**ARTICLE 10.****HALF-TIME SURVEY.**

§ 1. — The vessel must be placed in dry dock or on blocks, or hove down; when the bottom has been caulked within three years, this survey may be made afloat, if it meets the Surveyor's approval.

The hold to be cleared and cleaned, suitable stages

made inside and outside, all parts which may have suffered from iron rust, and such other parts as the Surveyors may direct, to be scraped bright.

The Surveyor must make a careful survey of the vessel; if considered necessary, bolts and treenails are to be backed out in sufficient number to ascertain their condition; treenails to be backed out of the bilges in all cases when practicable; particular attention must be directed to the bolts about the waterline (if they are of iron), the throat bolts of the iron knees and the outside planks through which they are driven. The beam ends must be examined.

The vessel must be opened inside by means of listings, from 3 to 4 inches in width, cut midway between the air-courses and the keelson over 1/3 of the vessel's length from each end on each side. When the bilge strakes are 5 inches or more in thickness, this listing must be cut in the first strake above the bilge strakes and in this case a second listing of the same width must be cut in the first strake under the bilge strakes for 1/3 of the vessel's length from each end on both sides. Should signs of decay or dry rot be found, the opening above the bilge must be extended from forward to aft.

Outside, the Surveyor must sound the planking of the topsides and require a sufficient number of treenails to be backed out in order to ascertain their condition as well as

that of the frame, specially under the chain-plates and under the counter. In all cases, the vessel to be opened under the counter on both sides, half-way between the quarter piece and stern-post, for examination of the stern frames.

When the topsides are not through treenailed, holes must be bored for examination of frame timbers and bolts or treenails of the required size driven in these holes.

Should signs of decay or dry rot be found, the Surveyor may require the removal of planks at the suspicious places and continue the openings as far as the case may require, and if necessary, cause the vessel to be opened from forward to aft.

Treenails backed out or openings made opposite the air-courses will not be accepted for survey.

The repairs required by the Surveyors must be executed under their superintendence, or a proportional reduction will be made from the term for which the vessel might otherwise be classed.

The Surveyor may, it considered necessary, require additional bolts to be driven through the keelson into the keel, when the centre line is iron fastened (not galvanized), unless the bolts can be backed out for examination, and shall also ascertain the condition of the windlass, of the rudder and its appurtenances, of the pumps, boats, masts, spars, rigging, &c., &c.

## ARTICLE 11.

### CONTINUATION OF THE 2/3 CHARACTER.

#### Survey.

§ 1.—The vessel must be placed in dry dock or on blocks or hove down; the hold cleared and cleaned; suitable stages made inside and outside; the butts of the outside planking, and all other parts which the Surveyors may direct scraped bright.

The Surveyor shall carefully examine the vessel; bolts and treenails must be backed out in sufficient number, and in all cases treenails must be backed out in the bilges, special attention must be directed to the bolts about the waterline (if they are of iron), the throat bolts of the iron knees and the outside planks, through which they are driven; the beam ends must be bored for examination.

The vessel must be opened inside by means of listings, from 3 to 4 inches in width, cut midway between the air-courses and the keelson over  $\frac{1}{3}$  of the vessel's length from each end, on each side. When the bilge strakes are 5 inches or more in thickness, this listing must be cut in the first strake above the bilge strakes, and in this case a second listing of the same width must be cut in the first strake under the bilge strakes for  $\frac{1}{3}$  of

the vessel's length from each end on both sides. Listings cut for a former survey will be admitted on this occasion.

For the examination of the topsides, the Surveyor shall require the removal of outside listings, equal at least in length, for the two sides together, to one entire strake from fore to aft, or require a treenail to be driven out in each third timber, from stem to stern, in each of the adjoining three strakes under the chain plates. When the vessel is not through treenailed, an equal number of holes must be bored of the size prescribed by the Rules for treenails. The Surveyor may also order listings to be cut on both sides under the counter, under the chain plates, near the stem and even between the chain plates if necessary, so that the united length of said listings be at least equal to the length of the vessel.

In all cases the vessel to be opened under the counter, on both sides, half-way between the quarter piece and sternpost, for examination of the transoms.

Should signs of decay or dry rot be found, the Surveyor shall require the removal of outside planks in the topsides, equal at least in length, for the two sides together to one entire strake from forward to aft. Should the frame or the planking be affected by dry rot or decay, the Surveyor shall require the removal of planks at the suspicious

parts, and continue the openings even if necessary from forward to aft on both sides.

Openings made opposite the air-strakes will not be accepted for survey.

The repairs required by the Surveyor, to be executed under his superintendence.

The Surveyor shall ascertain the condition of the windlass, of the rudder and its appurtenances, of the pumps, boats, masts, spars, rigging, &c., &c.

Additional bolts must be driven through the keelson into the keel (if not rebolted previously), when the centre line is iron fastened (not galvanized), unless the bolts can be backed out for examination.

§ 2. — Vessels so surveyed, when all the repairs considered necessary have been carried out, may obtain a continuation of 3 years on the 3/3 character, when they have obtained originally a *minimum rate of 8 years*; all others may obtain a continuation of 2 years.

§ 3. — This continuation of the 3/3 character may be extended on expiration, for 3 or 2 years, to which may be added the additional year granted by § 4 of Art. 7, when the vessel is submitted to the special survey required by Art. 12.

In this case the listings cut for obtaining the first con-

tinuation of 2 or 3 years will be admitted according to the preceding § 2.

## ARTICLE 12.

### SPECIAL SURVEY.

§ 1. — For the continuation of the 3/3 character or for the extension of the continuation granted agreeably to Art. 11, the vessel must be submitted to the following *special survey* :

The vessel must be placed in dry dock or on blocks, or be hove down, the hold cleared and cleaned; stages made inside and outside; the waterways, covering-board, hatch- and companion coamings, and also the topsides, to be scraped bright; the Surveyors must carefully inspect the vessel, bolts and treenails to be backed out in sufficient number for examination and in all cases treenails to be backed out in the bilges; where the iron bolts cannot be backed out, these parts must be rebolted if required by the Surveyors. Particular attention must be given to the bolts which are driven through the outside planking about the waterline (if of iron), the throat bolts of the iron knees and also the planks through which they are driven.

For the examination of the frames, the vessel must be

opened inside by a listing from 3 to 4 inches wide, cut midway between the air-courses and the keelson over 1/3 of the vessel's length from each end on both sides. When the bilge strakes are 5 inches or more in thickness, this listing must be cut in the first strake above the bilge strakes and in this case a second listing of the same width must be cut in the first strake below the bilge strakes for 1/3 of the vessel's length from each end on both sides. Listings cut for a former survey may be admitted in this case.

Should signs of decay or dry rot be found, the Surveyors may require the removal of planks at the suspicious places and continue the openings as far as the case may require, and if necessary, cause the vessel to be opened from forward to aft.

Outside the vessel to be opened under the counter on both sides, half-way between the quarter-piece and the sternpost, for examination of the stern frames; planks to be removed in the topsides, on both sides, equal at least to one entire strake from stem to stern on each side. This opening to be made as near as practicable under the chain plates, but care must be taken that no openings be made opposite the air-courses, as they cannot be accepted for survey.

For coasting vessels under 14 feet depth of hold, these outside openings may be made by listings.

The deck plank next to the waterway or lockstrake to be removed for examination of the beam ends; the keelson, the rudder, the masts, the waterways, knight-heads, hooks, transoms, topsides, ceiling, the seams under the quarter-pieces and trailboards, and under the head-knees and all other parts of the vessel and her appurtenances are to be carefully examined.

Additional bolts must be driven through the keelson into keel if iron fastened (not galvanized) and not recently rebolted and when the bolts cannot be backed out for examination.

The Surveyors shall carefully ascertain the condition of the bottom, and if necessary require the removal of the metal or wood sheathing for survey purposes.

The Surveyors shall ascertain the condition of the windlass, of the rudder and its appurtenances, of the pumps, boats, masts, spars, rigging, &c., &c.

The repairs required by the Surveyors must be executed under their superintendence.

The Administration, when specially requested by the Surveyors, may authorize a modification of the above prescribed survey.

§ 2. — The Administration will determine according to the report of the Surveyors, the character and term which are to be granted.

§ 3. — A continuation of the 3/3 character may be granted for a term of : 6 years, for vessels which have obtained *originally* a term of 12, 13, 14, 15 or 16 years; 5 years for those which have obtained originally 8, 9, 10 or 11 years; and 4 years for all others.

§ 4. — Vessels which have been submitted to the above survey before the time prescribed for it, shall obtain the years of prolongation they have a claim to, by being submitted to a survey regulated by the time which has elapsed since survey Article 12 was held.

§ 5. — The number of years for the 3/3 character shall not exceed the number of years granted originally, with the addition of the years allowed by § 3 of the present Article.

In some exceptional cases of good preservation however, and after a circumstanciated report of the Surveyors, the Administration may grant an additional extension of the 3/3 class, in one or more terms; the Administration shall then determine the survey to be held and the extension to be granted.

Vessels obtaining these exceptional extensions of class must be submitted to the periodical surveys prescribed by Article 6. When this is not attended to, the class may be withdrawn.

## ARTICLE 13

### CONTINUATION OF THE 3/3 CHARACTER AFTER REBUILDING.

§ 1. — The vessel can be restored to the 3/3 character when rebuilt, for a term not exceeding one-half of the original time, provided she be submitted to the following survey.

The Administration will, on receipt of a written application from the owner or his agent, appoint two Surveyors, who will hold the following survey :

§ 2. — The vessel to be placed in dry dock or on blocks; the decks, lockstrakes, waterways, covering boards, and the outside planking down to the light water-line, and all the ceiling and thickstrakes inside from light water mark down to be removed. All the remaining parts to be scraped or dubbed bright, the deadwoods, deadwood knees, stem, apron, sternpost, keelsons, keel, frames, and all other principal parts to be carefully sounded by boring and all that may be found defective to be renewed with new materials under the inspection of the Surveyors of the Administration. The quality of the material which has been used in the repairs shall determine the rate agreeably with Table B, and the term to be granted.

The surveyors must ascertain the condition of the rudder and its appurtenances, the pumps, boats, masts, spars, rigging, &c., &c.

§ 3. — In all cases the before-mentioned term shall commence from the date of the termination of the repairs.

§ 4. — The Administration will determine the character and number of years which are to be granted according to the report of the Surveyors, when the rebuilding is complete. *At the expiration of half the term of the restoration granted, the vessel must be submitted to the survey prescribed by Article 10;* when this is not attended to, the character will be suspended or withdrawn.

§ 5. — At the expiration of the restoration to the 3/3 character, this character can be continued for 3 years *maximum* after survey Art. 11.

## ARTICLE 14.

### FIRST TERM OF THE 5/6, 1.1. CHARACTER.

§ 1. — At the expiration of the 3/3 character, or of its continuation, the 5/6, 1.1. character may be assigned under the following conditions :

§ 2. — If submitted to *Survey Article 11* a first term of 4 years of the 5/6, 1.1. character may be granted to vessels having obtained *originally* a minimum term of 11 years, and 3 years for all others.

§ 3. — If submitted to the *Special Survey* (Art. 12) a first term of the 5/6, 1.1. character may be granted as follows :

## ARTICLES 14 AND 15

— 20 —

6 years to vessels having obtained *originally* a minimum term of 14, 15 or 16 years;

5 years to those having obtained *originally* a minimum of 11, 12 or 13 years;

and 4 years to all others.

## ARTICLE 15

### CONTINUATION OF THE 5/6, 1.1. CHARACTER.

§ 1. — At the expiration of the first term of the 5/6, 1.1. character assigned by Art. 14, the vessel in order to obtain the continuation of the 5/6, 1.1. character she is entitled to must be submitted either :

to the *Special Survey* (Art. 12) if the first term was obtained according to the requirements of the § 2, Article 14.

or to *Survey Article 11* if the first term was obtained according to the requirements of the § 3, Article 14.

§ 2. — The maximum term for which a vessel may be retained on the 5/6, 1.1. character, unless rebuilt, shall not exceed 10 years for vessels classed originally for a minimum term of 14 years; 9 years for those which have obtained 11, 12 or 13 years and 7 years for all others.

§ 3. — This maximum term is to be reckoned from the time of the expiration of the 3/3 character or of the extension allowed by Art. 11, 12 or 13.

§ 4. — No character can be assigned after special survey before the detailed report of the repairs has been approved of by the Administration.

### Exceptional continuation of the 5/6, 1.1. character.

§ 5. — When at the expiration of her maximum term of the 5/6, 1.1. character a vessel is found in such a good state of preservation as to justify the Surveyor to propose an exceptional continuation of the same character, he will send a special report to the Administration who will appoint a second Surveyor to proceed with him to a special survey of the vessel.

The vessel shall be surveyed according to Article 12, but the Surveyors may extend the outside and inside openings if considered necessary.

The maximum term assigned after this survey shall not exceed 6 years for the vessels of the 13 years' type and above, 5 years for those of 10 years' type and above, 4 for the others.

If the periodical surveys prescribed by article 6 are not complied with during these exceptional extensions, the character may be withdrawn.

ARTICLE 16.

**RESTORATION OF THE 5/6, 1.1. CHARACTER  
AFTER REBUILDING.**

§ 1. — Vessels whose outside and inside planking and decks have been renewed, and all defects made good or repaired under the inspection of the Surveyors of the Society, either at one time or by partial repairs at different times, may be restored to the 5/6, 1.1. character, for a total term not exceeding 10 years for vessels rated for a minimum term of 14 years; 9 years for those which have obtained 11, 12 or 13 years, and 7 years for all others.

§ 2. — The rates fixed according to Table B by the timber used in the original construction shall be modified by that used in the repairs, to which may be added the additional years allowed by Article 7 § 2, for the use of yellow metal or galvanized iron fastening and salting.

§ 3. — These terms of restoration shall in all cases commence from the date of completion of repairs, or if made at different times so as to complete finally the whole of the above mentioned requirements, from the date when the first of these repairs were effected.

§ 4. — To obtain this advantage, the vessel must be submitted to the survey required by Art. 15 § 1, and

the terms granted shall not exceed 6 years for those rated for at least 10 years, 5 years for those rated for at least 9 years, and 4 years for all others.

§ 5. — When on expiration of the term allowed by § 4, a balance of years is left to complete the total term allowed by § 1 of this Article, the extension will be granted, provided the vessel be submitted to the survey required by Article 10.

ARTICLE 17.

**5/6, \* 2.1. CHARACTER.**

§ 1. — At the expiration of the 5/6, 1.1. character, the vessel may be classed 5/6,\* 2.1.; she must then be submitted to the survey prescribed by Art. 10 and all necessary repairs must be executed to the Surveyor's satisfaction.

§ 2. — The first term of the 5/6,\* 2.1. character may be 4 years for vessels which have obtained *originally* a minimum term of 11 years, and 3 years for all others.

§ 3. — At the expiration of the first term of the 5/6,\* 2.1. character, the vessel in order to have this character continued must be submitted to a survey to be determined by the Administration, after a provisional survey by the Surveyor.

## ARTICLE 18.

## 3/4, 2.1. CHARACTER.

The 3/4, 2.1. character may be granted after the expiration of the periods fixed for the 5/6 character, for one year, provided that the vessel has been found to be in a good seaworthy condition at the time of the previous surveys and openings, regulated by the preceding Articles. The vessel must be moreover submitted to the survey prescribed by Art. 10.

## ARTICLE 19.

§ 1. — In case of disagreement between builder or owners and the Surveyors, in relation to the expected class, the dispute may be referred to a commission composed of two arbitrators, selected by both parties, and should they disagree, an umpire may be appointed by them, or by the chairman of the Tribunal or of the Chamber of Commerce at the request of either party. The commission must confine itself to examine the application of those Articles which have caused the dispute, and must in the award particularly state if the Surveyor has wrongly interpreted these Articles.

§ 2. — If the dispute is in relation to the amount and nature of the repairs or changes to be made agreeably

with the requirements of Articles 6, 9, 10, 11, 14, 15, 16, 17 and 18 for the maintenance or the prolongation of the 3/3, 5/6 and 3/4 characters within the limits fixed by Articles 2, 10, 11, 14, 15, 16, 17 and 18, the dispute is to be submitted to a commission composed of two arbitrators, one selected by each party; and should they disagree, a shipbuilder must be appointed as umpire by them, or by the chairman of the Tribunal or of the Chamber of Commerce. The conditions of the surveys required by Articles 6, 9, 10, 11, 14, 15, 16, 17 and 18 must be considered and mentioned in the award; the commission must decide on the amount and importance of the required repairs.

§ 3. — In case of disagreement between the builder and the Veritas Surveyor, during the building, on the interpretation of Articles 5, 7, 20, 21, 22, 23, 24, 25, 26, 27, 28, and Tables A, B, C, &c., the dispute must be submitted to a commission composed of two shipbuilders and the Veritas Surveyor; the two shipbuilders must be named by the chairman of the Tribunal or of the Chamber of Commerce, at the request of the owner or by mutual agreement.

No arbitration can be admitted after the vessel has been launched.

§ 4. — The Rules being the basis on which all vessels are classed in the Register Veritas, the decision of the

commission must be grounded on the Rules, and the decision will be without appeal.

§ 5. — The above mentioned commission cannot be admitted in cases of special survey covered by Articles 12 and 13.

§ 6. — The payment of the expenses incurred in the settlement of the matter in dispute, shall constitute the only claim that can be recovered from the party which fails.

§ 7. — Whether the vessel be classed or not the

survey fees, according to the scale, become due when the Surveyor has been requested to inspect the vessel.

§ 8. — The Administration does not hold itself responsible for any omissions or typographical errors which may exist in the Register or the Supplements. The parties interested are requested to examine the information given, and address their observations to the Administration. The errors or changes will be corrected in the Supplements. After the expiration of the class the vessel is retained in the Register without a character.

## BUILDING OF WOODEN VESSELS

## ARTICLE 20.

## PRINCIPAL DIMENSIONS.

LENGTH. — The length to be taken from the after side of the stem to the fore side of the sternpost, measured on the range of the upper deck, or middle deck in three-deck vessels.

BREADTH. — The breadth to be taken inside the ceiling at the widest part of the vessel.

DEPTH. — The depth to be taken from the ceiling to the upper side of upper-deck beams at midship, and mid-length.

Seven-tenths of the sum arising from these dimensions multiplied into each other shall determine the scantlings, dimensions, &c., given in the annexed Tables. (*For anchors and chain cables, see Art. 27, § 5.*)

When iron or steel parts are employed in the construction of wooden vessels, such as beams, keelsons, etc., the scantling numbers for such parts shall be calculated

according to the Rules for iron and steel vessels, and their scantlings determined as per Tables annexed to said rules.

The durability of a vessel depends not only on the strength of the materials used, but also on the quality and on the care taken in building. In estimating the efficiency of the scantlings, compared with the dimensions given in Table A, the Surveyor must take into consideration the quality of the timber and the system of construction. The use of good and efficient materials is not in itself sufficient; the workmanship must also be good.

All the materials must be of good quality.

---

KEEL. § 1. — The keel pieces not to be under 50 feet in length, except the forward and after lengths which may, if desired, be of short lengths, but in all cases must be properly shifted with the lower pieces of the deadwoods.

An outer or lower keel will be required, when the keel is composed of shorter lengths, and, in that case, the upper or main keel must have at least two-thirds, and the lower

keel one-half of the moulded size required by the Table of Scantlings A.

The rabbet to be cut in the keel, so as to leave a good back rabbet.

The scarphs of the keel to be flat, or horizontal and to have, in length, at least five times the moulding side of the keel. Keel scarphs and garboard strakes butts must not be placed under the masts and not nearer than six feet thereto.

The points of scarphs to have, in thickness, one-quarter of the full moulded size of the scarphed parts.

STEM. § 2. — The stem, whenever practicable, to be in one piece when in two pieces, the scarph to be in length at least three and a-half times the moulded size of the stem, and not to be near the bobstay plates, and in all cases, to be strengthened by an apron of suitable dimensions.

When the vessel is built without a fore-foot knee, the stem must step on the keel, and be connected with it by a tenon or hook; dovetail plates shall be fitted on each side of stem and keel.

STERNPOST. § 3.— The sternpost to be of one piece, properly stepped and connected with the keel by means of a tenon and dovetail plates on each side. A heel knee to be introduced in order to strengthen this connection.

FRAME. § 4. — Length of floors in midship body not to be less than half the vessel's beam, and the shift of timbers to be equal to  $1/7$ th of the main beam.

The forward and after cant timbers to be let into the deadwoods and their heels to be bolted through same.

The timbers at the light water mark and at the covering board to be of the dimensions required by Table A. The rough-tree stanchions to have the same dimensions as the top-timbers at the planksheer.

For the spacing of frames see Table A.

KNIGHTHEADS AND HAWSE TIMBERS. § 5.— The knightheads and hawse timbers must be in one length, and have double the siding of the frame.

STERN TIMBERS. § 6. — The moulding of the stern timbers to be one-third more at the heel than the heads of the top-timbers.

KEELSON. § 7. — The scarphs of the keelson to be properly shifted with those of the keel; their length to be equal to five times the moulding side of the keelson. A hog or rider keelson having  $2/3$ ds of the section of the main keelson, given in Table A, will be required, whenever the latter is composed of more than three lengths.

The hog keelson will be required, whenever the vessel's length exceeds 128 feet, or seven times her depth of hold in vessels exceeding 88 feet long.

Whenever the main keelson is smaller than required by the Table, a rider keelson is to be fitted of such dimensions that the resulting sectional area be  $1\frac{1}{2}$  times the tabular area.

CLAMPS. § 8. — The clamps to be scarphed. These scarphs to be  $3\frac{1}{2}$  times the width of the clamps. The lower deck clamps to have the same dimensions as those of the main-deck.

The scarphs of the clamps to be well shifted with those of the waterways; no scarphs are allowed in wake of main hatch.

BEAMS. § 9. — The beams to butt against a timber so that the throats of the hanging knees may be properly bolted; pillar stanchions to be introduced under every beam. Stanchions under every second beam will be allowed, when a fore-and-aft piece is introduced.

Stanchions under deck beams may be dispensed with in vessels classed for the great coasting trade (G) and employed in this navigation, provided the vessel's beam does not exceed thirty feet and under the following conditions: the spacing between the beams not to exceed 3 feet, all beams to be secured by hanging knees or knee-riders of the size required by the Rules, and all scantlings of beams, frames and keelson to exceed the requirements of Table A.

To obtain this exemption, the surveyor must submit his report for the approval of the Administration.

It is recommended to increase the scantlings of the beams placed at the ends of the large hatchway and mastpartners.

CARLINGS AND FORE-AND-AFTERS. § 10. — When carlings are required by the Rules, their dimensions to be equal to one-half the sectional area of the beams, and to be supported in the middle by fore-and-aft pieces having for dimensions one-half of the sectional area of the beams.

The fore-and-aft pieces for mast-partners and hatch-coamings to be three-fourths of the section required for the beams.

STANCHIONS. § 11. — The stanchions, when of wood, to be of a size equal to two-thirds the sectional area of the beams under which they are placed; they should be strongly fixed to the keelson and beams.

Iron stanchions to be one-sixteenth of an inch in diameter for every foot of the sum of the beam and depth. Tween-deck stanchions may be reduced 25 per cent in size.

SPIRKETTING. § 12. — When a spirketting is introduced, the thickness to be the same as that of the clamp, and the height from 2 to 4 inches above the waterway.

WATERWAYS. § 13. — A waterway to be fitted on each tier of beams. The different lengths of the waterways to be scarphed vertically, the scarphs having in length three and a-half times the moulding side of the waterway. The scarphs of the waterways to correspond as near as possible with the middle of the corresponding length of clamp underneath.

Vessels exceeding 92 feet in length must have a lockstrake or inner waterway, the butts or scarphs of which must be properly shifted with the scarphs of the waterway. It is recommended to fit the beam ends into a recess in the clamps.

INSIDE BILGE STRAKES. § 14. — The inside bilge strakes must extend from one strake below the floor heads (short floor heads in double floors) to one strake above the heels of the third futtocks; but in no case must their entire width be less than one-sixth of the vessel's beam.

LIMBER STRAKE. § 15. — Whenever the first futtocks (or naval timbers) do not meet in the middle line between the keelson and keel, a limber strake to be introduced, having the same dimensions as the inside bilge strakes, bolted through the floors, so as to secure the heels of the first futtocks or naval timbers.

WALES. § 16. — The wales to be in width one-third of the vessel's depth of hold, when the length from stem to

sternpost does not exceed six depths; the width of the wales to be increased to two-fifths the depth of hold, when the length attains eight depths.

OUTSIDE BILGE STRAKES. § 17. — The total width of the outside bilge strakes to be the same as that of the inside bilge strakes, and may be gradually reduced in thickness so as to correspond with the adjoining planks. The width of the planks not to exceed 12 inches.

If the outside bilge strakes are not of the size required by the Rules, the inside bilge strakes to be increased in proportion.

SHIFTING OF BUTTS. § 18. — The butts of all outside and inside planking to be regulated as follows :

The butts of two adjoining planks not to be nearer to each other than five feet; when there is a strake wrought between them, four feet will be allowed and where two strakes are wrought between them, three feet, and no butts to be on the same timber without three strakes between them; no plank to be less than twenty-two feet in length.

The butts of the garboard strakes not to be nearer to the butts of the scarphs of the keel than five feet.

The butts of the deck planks not to fall upon the carlings; the butts of two adjoining planks not to be nearer to each other than two spaces of beams; no butts to be on the same beam without having three strakes between them.

No deck plank to be less than 23 feet in length, except those at the forward and after ends, or between hatches.

REDUCTION OF THE PLANKING TOWARDS THE ENDS. § 19. — The outside and inside planking must retain the thickness required by the Rules over three-fifths of the vessel's length in midship, and towards the ends a gradual reduction will be allowed, so as to retain at the hood ends four-fifths of the thickness required in midship. However no reduction will be allowed on planks having less than 3 inches in thickness.

BREAST HOOKS AND CRUTCHES. § 20. — Vessels having less than 13 feet depth of hold must have three breast-hooks forward and one crutch aft; those having from 13 to 15 feet to have four breast-hooks forward and two crutches aft. Beyond this depth the mean spacing of the hooks and crutches in the hold not to exceed three feet.

The length of the hooks and crutches and their pointers, to be equal on each side to one-quarter of the vessel's beam.

The pointers of the lower hooks and crutches in the hold to cross the ceiling at an angle of 45 degrees.

When the pointers are of wood, their dimensions to be three-fourths the size of deck beams; and when in two lengths, to be connected by scarphs in length equal to three and a-half times the moulded size of pointers.

When of iron, the hooks and crutches must have the dimensions required by Table D.

TRANSOM KNEES. § 21. — The main transom to be connected to the sides by two horizontal knees.

WOOD KNEES. § 22. — The siding of wooden knees not to be less than eight-tenths the width of the piece to which they are bolted, and to be across the throat at least one and a-half times their siding.

The knees to be sufficiently long to receive from five to seven bolts in the side arm, and from three to four bolts in the beam arm.

All wooden knees to be natural crooks, and not to be cut across the grain.

POOPS AND FORECASTLES. § 23. — The framing of poops and forecastles to be formed by the extension of the top timbers.

A reduction of  $\frac{1}{4}$ th will be allowed on the moulding or thickness of the beams and all other parts of the poops and forecastles, from the corresponding parts of the main-deck.

A reduction of  $\frac{1}{4}$ th will be allowed on the siding and the moulding of the frame, when all the timbers extend to the poop- or forecastle deck. The space between the frames to be closed by a covering board so as to be watertight at the level of upper deck waterway.

The main-deck waterways, the clamps and thickstuff to extend from fore to aft without interruption.

HURRICANEDECK. § 24. — When the poop and the fore-castle are connected so as to cover the deck from fore to aft, such vessels are inserted in the Register under the denomination of *Hurricanedeck*.

The second deck in such vessels to be fitted in every respect as an exposed deck with scuppers and pipes leading to the bilges, and the scantlings of the second deck to be equal to those of the second deck in two- or three-deck vessels.

SPARDECK. § 25. — Vessels having two or three decks and no topgallant fore-castle or poop, intended for passengers or lightgoods, will be allowed a reduction of  $\frac{1}{4}$ th on the moulding or thickness of their scantlings above the second deck, of what is required for the corresponding parts in two- or three-deck vessels, not being spardeck vessels.

The length may be measured on the main deck, and the tabular depth reduced by half the height of the tweendeck.

Deckhouses on spardecks not to cover more than one-tenth of the surface of the deck.

When the windlass is fitted on the main-deck of hurricane or spardeck vessels, a watertight bulkhead is to be built before the foremast, and scuppers fitted at the corners.

SCUPPERS. § 26. — Scuppers of proper size and sufficient in number, to be fitted on all upper, main or lower decks.

§ 27. — When iron is substituted for wood in certain parts of the vessel, the dimensions of these parts to be regulated by the Rules for iron vessels, and a mid-ship section to be sent to the Direction by the Surveyor.

## ARTICLE 21.

SPACING OF BEAMS. § 1. — The spacing of beams on which a deck is to be laid not to exceed three feet three inches; this spacing shall be reduced if beams of lesser scantlings than those given by the tables are used; it may be increased if carlings are introduced.

§ 2. — Vessels having a depth amidships of from 8 to 13 feet between top of floors and under part of deck, will have, to the mast beams, and to the beams at ends of main hatch, knee-riders of sufficient length to receive two bolts through the floors.

§ 3. — Vessels having between 13 and 15 feet depth of hold to have hold beams under every second deck beam, except in the fore and after ends, where they are not required by rule.

§ 4. — Vessels having between 15 and 18 feet depth of hold to have hold beams under every second deck beam.

## ARTICLES 21 AND 22

— 30 —

§ 5. — Vessels having 18 feet depth of hold to have hold beams under every deck beam and under every second deck beam alternately.

§ 6. — Vessels having 20 feet depth of hold to have hold beams under every deck beam.

§ 7. — The beams in all cases to correspond vertically with each other.

§ 8. — Vessels having 20 feet depth of hold and less than 24 feet, to have an orlop beam at the bow, near the pointers, between the keelson and the hold beams connected to the side by two horizontal knees at each end.

§ 9. — When the height between the beams is over 8 feet, a beam to be introduced at the bow between the beams, and connected with the side by two lodging knees at each end.

§ 10. — Vessels having over 24 feet depth of hold to have two full tiers of beams and orlop beams under every second hold beam.

§ 11. — Vessels having eighteen feet depth of hold and upwards to have mast partners fitted to the hold beams.

HATCHES. § 12. — No hatch to have more than 10 feet in length. The system of compensation must be submitted for the approval of the Administration, when larger hatches are required.

## ARTICLE 22

KNEES, STRAPS AND DIAGONALS. § 1. — All deck, 'tween-deck, poop, forecastle and orlop beams to be efficiently connected to the side by lodging knees or some other effective system of fastening equivalent thereto.

§ 2. — Vessels from 60 to 100 tons register to have six pairs of vertical hanging knees to main-hatch beams, and in wake of the rigging.

Vessels coming between the numbers 10,000 and 15,000 to have eight pairs of vertical hanging knees to the deck beams.

Those at 15,000 to have ten pairs of knees.

» 20,000 » twelve »

» 25,000 » fourteen »

» 30,000 » sixteen »

Those at 40,000 and upwards to have two vertical hanging knees to each deck beam, except in the ends of the vessel, when the angle is too acute (Table D).

§ 3. — All hold beams to have vertical hanging knees of the dimensions given by Table D, except at the ends, as above. The hanging knees in way of masts and main hatch to be of sufficient length to receive two bolts in the floor heads.

§ 4. — The knees and kneeriders in the ends of the vessel to be diagonal.

The beams of poops and forecastles to be provided with hanging knees.

§ 5. — When the vessel's length exceeds ten times the depth of hold, diagonal iron plates to be introduced outside on the timbers, from 6 to 8 feet apart: — Four of these diagonals to cross one another at right angles in midship. These plates to extend from the covering board to the floors, and to receive two bolts in each frame timber they cross.

Sizes of iron plates on frame:

For vessels of 300 tons and under,	$3\frac{1}{2}$ inches	by	$\frac{5}{8}$
» 300 to 500 tons,	4	»	by $\frac{1}{2}$
» 500 to 700 »	4	»	by $\frac{5}{8}$
» 700 to 1000 »	$4\frac{1}{2}$	»	by $\frac{3}{4}$
» 1000 to 1500 »	5	»	by $\frac{3}{4}$
» 1500 tons and above,	$5\frac{1}{2}$	»	by $\frac{3}{4}$

§ 6. — Vessels built of pine, hackmatack, larch or spruce, of 700 tons and upwards, to have iron straps on the frame as stated above; any other efficient system of strengthening may be accepted as an equivalent.

§ 7. — In vessels built of pine, larch, hackmatack, spruce, or other woods of the same kind, all hanging knees in the hold to be of sufficient length to receive

two bolts in the floorheads. The thickness of these kneeriders throughout may be  $\frac{1}{2}$  inch less than the thickness at throat bolts, indicated in Table D.

§ 8. — In case such vessels have short hanging knees-plain iron straps to be substituted between the beams, for the requirements in the preceding paragraph; these straps are to be bolted in the upper or lower deck clamps at the case may be.

## ARTICLE 23.

### BOLTS, SPIKES AND TREENAILS.

KEEL SCARPHS AND THEIR BUTTS. § 1. — The bolts in the scarphs of the keel and other principal parts not to be more than 12 inches apart.

The butts of the scarphs of the keel to be fastened by two bolts.

FRAME. § 2. — The frame timbers to be connected with four square frame bolts in each futtock.

The ends of floors and of first futtocks (naval timbers) to be bolted to the inside bilge or thick ceiling strakes, whenever double floors are used, these bolts to be clinched on rings of the same metal.

KNIGHTHEADS. § 3. — The knightheads to be bolted to the apron and to the hawse timbers.

## ARTICLE 23

— 32 —

KEEL AND KEELSON. § 4.—The keel and keelson to be bolted in every floor timber; half of the bolts may be dump bolts, and must in that case be driven at least through  $\frac{3}{4}$  of the thickness of the keel; the other half to be clinched under the keel, or on the keelson when the vessel is hove down.

DEADWOODS. § 5. — The in and out bolts on the faying surfaces of the deadwoods not to be further apart than the keelson bolts.

These bolts to be driven through the stem and the sternpost and to be of copper or yellow metal, when the vessel is to be copper or metal sheathed.

MAIN TRANSOM. § 6. — The main transom to have two bolts diagonally through the sternpost, clinched outside.

CLAMPS AND THICKSTUFF. § 7. — The upper deck clamps and thickstrakes under them, of vessels under 300 tons register, to receive one bolt in each frame; when 300 tons and above to receive two bolts in each frame, driven through from outside and clinched on the inside.

The second and third deck clamps and thickstrakes under them to receive two bolts in each frame; these bolts may be clinched on the frame or on the clamp or thickstrake.

When, according to the Rules, the clamps are six inches in thickness or upwards, they must be tie-bolted to the thickstuff below them, having a bolt in every second room.

BEAMS. § 8. — The beam ends to be secured with a bolt driven through the waterway or stringer and the clamps.

WATERWAYS. § 9. — The upper deck waterways to be bolted into clamps through each beam end, and to have one through bolt in each frame clinched on the inside of waterways.

The same system of bolting to be adopted for the tween-deck and lower-deck stringers, but these bolts may be clinched on the frame, or on the stringer.

LOCK STRAKES. § 10.—The lock-strakes to have a through-bolt in every beam clinched on the under side, and a bolt in every frame driven through the waterway frame and outside planking, and clinched on the planking or on the lockstrake.

The same system of bolting to be adopted for the 'tween-deck and lower-deck stringers, but these bolts may be clinched on the frame, or on the stringer.

INSIDE BILGE STRAKES. § 11. — Besides the bolts and treenails required by § 14, each inside bilge strake to be secured with a through bolt in every third frame over  $\frac{3}{5}$ ths of the vessel's length amidships. These bolts to be driven through from the outside and clinched inside on rings of the same metal.

Two years shall be deducted from the term allowed by Table B, when these bolts are not driven through.

They shall be required whenever the vessel's class is continued or extended; when the bilge strakes are six inches or upwards in thickness, these strakes to be tie-bolted in every third room, independently of the bolts and treenails required by §§ 13 and 14.

GARBOARD STRAKES. § 12. — When the garboard strakes are six inches or upwards in thickness, they must be edge bolted into the keel in every second room, over  $\frac{3}{5}$ ths of its ength, independently of the bolts and treenails required by §§ 13 and 14.

BUTTS OF OUTSIDE AND INSIDE PLANKING. § 13. — All butts of outside planking to be secured by two bolts, at least one of which must be clinched inside on rings of the same metal. When the through bolt is driven through the timber next to the butt, the latter to be secured at each end with two dumpbolts.

Two years shall be deducted from the term allowed by Table B, when the butts are not throughbolted.

They shall be required whenever the vessel's class is continued or extended.

All inside planks when under 8 inches in width to receive one dumpbolt in each butt end, and two bolts when 8 inches or over.

OUTSIDE AND INSIDE PLANKING. § 14. — Outside planks under 8 inches in width to have two bolts or two treenails

in each frame (single fastening); when 8 inches wide and under 10, three bolts or treenails in each frame (double and single fastening); and when 10 inches and above, four bolts or treenails in each frame (double fastening).

Each inside plank to receive at least two treenails or two bolts in each frame. Additional dumpbolts to be driven when the treenails or bolts from the outside are not driven through in sufficient number, to comply with the above requirements.

Where dumpbolts are used they must be driven at least through three-fourths of the moulded size of the frame timbers, and every fifth bolt must be a through bolt clinched on the inside. Two-thirds of the bolts to be through and clinched on the inside when copper or yellow metal is used.

BILGES. § 15. — Vessels built of hackmatack, spruce, pine, or other woods of same quality, must have their bilges treenailed with locust or wood of equal quality to be entitled to the minimum of eight years given in Table B.

FLAT OF BOTTOM. § 16. — The outside planking in the flat of floor may be bolted with dump, or similar iron, or yellow metal bolts (copper excepted).

HOOKS AND CRUTCHES. § 17. — The iron hooks and crutches to be bolted with one strong bolt in the throat, through the apron and stem or sternpost. The arms to

have a bolt in each timber. All these bolts to be clinched on the outside.

When the hooks, crutches or pointers are made of wood, two bolts must be driven in each timber. These bolts must be clinched on rings; but every third bolt only will be requested to be driven through the outer planking.

KNEES. § 18. — All iron hanging or lodging knees to have three or four bolts in the beam arm, and according to their length, five or seven in the side arm of hanging knees, and the side arm of lodging knees to have one bolt in each timber. The distance between the throat bolt of hanging knees and the next bolt not to exceed nine inches.

Wooden knees to receive a larger number of bolts to the Surveyor's satisfaction.

§ 19. — All the bolts of iron knees or straps to be driven from inside, and clinched on outside planking. Those in the beam arms to be clinched on the beams.

In vessels built of pine, larch, hackmatack, spruce, birch, beech, elm or other woods of the same kind, all bolts of *iron* hanging knees, straps, crutches or breast-hooks must be driven through and clinched on the outside.

In vessels built of oak or woods of the same kind, the

throat bolts and the next bolt to it, of *iron* hanging knees must be driven through and clinched on the outside, all other bolts may be clinched alternately on the frame and on the outside planking.

All bolts to be driven through and clinched outside when cross chocks have been used in the frame.

The distance between the bolts, in iron riders, not to exceed eighteen inches above the bilge strakes, and ten inches in the bilge strakes.

COVERING-BOARDS. § 20. — The covering boards to be fastened by a clinched bolt through the rough-tree stanchions; and vertically through the sheerstrake and the waterway, by bolts spaced about 12 inches apart. When the width of the covering boards is made up of several pieces, they must be fastened together by one or more bolts in each space between the rough-tree stanchions.

FRAME BOLTS. § 21. — The size or diameter of the square iron or frame bolts to be one-twelfth of the siding of timbers.

BOLTS. § 22. — The bolts for all principal parts must have the diameters given in Table C; all other bolts to be in proportion to the parts which they connect, except the chain, ring and eye-bolts which should have nearly the double of the dimensions.

TREENAILS. § 23. — The size of oak or locust treenails to be in proportion to the size of the wood through which they pass. Their mean size for vessels of 200 tons to be  $7/8$  inch; for 300 tons, 1 inch; for 400 tons,  $1\frac{1}{8}$  inch; for 500 tons,  $1\frac{1}{4}$  inch, and  $1\frac{3}{8}$  inch for vessels of larger tonnage. When hackmatack, pine, or timber inferior to oak is used for treenails, their diameter must be increased by one-eighth of an inch.

They must be at least equal in quality to the material through which they are driven, free from knots and sap, well-seasoned young oak or locust being preferred.

They must be wedged inside athwart the fibre of the planking, and caulked outside.

SPIKES. § 24. — In vessels the frames of which are built of oak, clinched through-bolts and spikes may be substituted for treenails on the proportion of one bolt to every alternate timber.

The spikes to be at least an inch longer than twice the thickness of the planking they traverse, and to be galvanized when it is intended to salt the vessel.

§ 25.— All new vessels, iron or galvanized iron fastened and metal or copper sheathed over felt, will not be classed for a longer term than five years in the division they belong to.

The class is liable to be withdrawn if, after three years, the state of preservation of the fastenings under the

metal sheathing has not been ascertained by a Surveyor of the Veritas.

§ 26. — Vessels so fastened and sheathed may obtain the seven years' class, if the bolts are protected by felt and wood sheathing.

In that case the class is liable to be withdrawn if, after five years, the Surveyor has not been enabled to examine the state of the fastenings under the wood sheathing.

§ 27. — Vessels, iron or galvanized iron fastened which have obtained an original term exceeding 5, 6 or 7 years, to be subject to biennial surveys, when sheathed with metal or copper.

§ 28. — Vessels, which have their centre line fastened with iron bolts, and the bottom planking copper fastened, shall be registered as copper or metal fastened, and shall be inscribed in the Register, copper or metal fastened with the mark — Q. chv. fr. — (Keel iron fastened.)

When the wales are iron fastened they must be wood sheathed before being coppered or sheathed with yellow metal. Vessels so fastened, shall be inscribed copper or metal fastened, with the mark — Prc. chv. fr. — (Wales iron fastened).

Vessels which are partly iron and partly metal fastened under the metal sheathing shall be considered as iron

fastened, and shall be inscribed in the Register copper or metal, and iron fastened.

Vessels, which are metal sheathed, should have their deadwoods fastened with metal bolts even although the bolt heads are plugged.

Iron bolts not galvanized, are not allowed for the bolting of beech planking, or keels.

§ 29. — Iron bolts not to be nearer to the metal line than 12 inches.

§ 30. — Additional bolts must be driven through the keelson and the keel (unless the bolts can be backed out for examination) when the centre line is iron fastened (not galvanized). This will be required at least once in every eight years.

#### ARTICLE 24.

##### CAULKING.

§ 1. — The new or first caulking of planks requires a number of threads of tarred oakum proportionate to their size, making a difference between the part constantly under water, that only under water during a certain time, and that always above water, as topsides and decks.

§ 2. — The conditions of good caulking are :

1° The planks are to fit closely to each other on the inside; 2° the oakum to be of good quality, and to fill the seams well without passing entirely through.

#### ARTICLE 25.

##### THE BOTTOM AND SHEATHING.

§ 1. — If four years maximum have elapsed since the bottom was caulked, the butts, garboard seams, bilges and wood ends to be well examined and tried.

At this time the Surveyor shall require the bottom to be caulked if necessary. But if in his opinion the recaulking may be postponed, he shall fix a date (not exceeding two years) within which the recaulking has to take place, and a note to this effect shall be put on the certificate and survey report.

§ 2. — The Surveyor shall carefully examine the state of the sheathing and note its weight and how long it is likely to last.

§ 3. — The Surveyor must be called in whenever the bottom is caulked.

§ 4. — Vessels classed for Atlantic or Long voyages must be stripped, when the metal sheathing is over five years old.

§ 5. — When the wood sheathing or the boottopping is over seven years old they must be removed.

#### ARTICLE 26.

##### MASTS, RIGGING, RUDDER AND WINDLASS.

The masts, spars, rigging and the whole outfit, to be in good condition.

In vessels copper or yellow metal fastened, the rudder pintles and braces must be of brass to above the deep load water line. The bolts of rudder braces to be of copper.

The spindle of the windlass to extend the full length in one piece.

The length of the windlass must not exceed  $5\frac{1}{2}$  times the diameter of the body.

## ARTICLE 27.

### INVENTORY.

All vessels to be provided with anchors, chain cables and hawsers, as required by the Tables E<sup>1</sup> and E<sup>2</sup>, and to have two efficient hand pumps with spare lower and upper boxes.

The bores of the pumps not to be less than :

3	inches	for vessels under 300 tons.
4	" " "	over 300 not exceeding 600 tons.
5	" " "	" 600 " " 2000 "
6	" " "	" 2000 tons.

COASTING TRADE. § 1. — One complete suit of sails.

SPARE SAILS. — Sailing vessels to have : One foretopmast staysail, one trysail for fore- and aft-rigged vessels ; one foretopmast staysail, one foresail, one complete square topsail for square-rigged vessels.

ATLANTIC TRADE. § 2. — One complete suit of sails.

SPARE SAILS. — Sailing vessels to have : One jib, one foretopmast staysail, one trysail for fore- and aft-rigged vessels.

One jib, one foretopmast staysail, two complete topsails, one foresail, and one topgallant sail for square-rigged vessels.

SPARE SPARS. — Sailing vessels to have : One topmast, and one spar fit for a topmast and for a lower yard.

LONG VOYAGES. § 3. — One complete suit of sails.

SPARE SAILS. — Sailing vessels to have : One foresail, one mainsail, two complete topsails, two topgallantsails, one jib and one foretopmast staysail.

SPARE SPARS. — Sailing vessels to have : One top mast, one spar fit for a topmast and for a lower yard, and one topsail yard.

*All auxiliary steamers will be considered as sailing vessels.*

BOATS. § 4. — All vessels to have a boat fit to carry a stream anchor. Vessels under 100 tons register to have one boat; vessels over 100 tons and under 400 tons, to have two boats, and above this tonnage to have at least three boats, according to size, one of which must be fit to carry a stream anchor.

ANCHORS, CHAIN CABLES AND HAWSERS. § 5. — The weight of anchors, the diameter of chain cables and the circumference of hawsers will be determined by the numbers given in Tables E<sup>1</sup> and E<sup>2</sup> (the depth being in all cases measured to the upper deck), in which half the capacity of all the deck erections is added to the scantling numeral.

A reduction of one-third to be allowed on the number for the anchors and chain cables of fullpowered steamers.

§ 6. — Vessels supplied with Anchors or Chain Cables, which have been submitted to Veritas proofs at a testing machine recognized by the Administration, will be inserted in the Register with the following marks :

A. P. for Anchors.

C. P. for Chains.

A. & C. P. for Anchors and Chains.

All vessels built under special survey must have their anchors and chains tested as above stated. (See also Art. 5 § 4.)

§ 7. — Vessels may be classed provisionally without navigation mark, or marks of hull and stores, if the latter are not complete at the time when the class is granted.

#### ARTICLE 28.

Vessels which differ in their mode of construction or fastening from the Rules prescribed by the Veritas can be classed for a term determined by the minimum of years granted in Table B to the timber used in the construction, and by the additional years granted by Art. 7, provided that the materials, scantlings, fastenings &c., are of the very best quality and efficiency.

Paris, 1<sup>st</sup> January 1908.

EDMOND BAL,  
*Acting Director.*

A. BERLHE DE BERLHE,  
*Chief of the Technical Department.*

REDUCTIONS AND AUGMENTATIONS. — The above Table gives the principal dimensions for Vessels built of Oak Timber. A reduction from 1/8th to 1/10th in the moulding side or thickness is allowed for Oak of the South of France (Provence), and of Italy, also for Timber classed 12 in Table B. The dimensions of Pine, Spruce and Birch, to be augmented 1/5th in the moulding side or thickness ; this augmentation to be of 1/8th for Pitchpine, Larch, Hackmatack, or Red Pine. These augmentations to be doubled for all inside planking, such as clamps ; thick stuff, bilge strakes, and ceiling ; for pitchpine, however, these augmentations may be limited to 1/8 everywhere.

This Table, which refers to a somewhat different pattern of construction, may be used for vessels whose numeral is under 15000, in lieu of Table A<sup>1</sup>.

REDUCTIONS AND AUGMENTATIONS. — The above Table gives the principal dimensions for Vessels built of Oak Timber. A reduction from 1/8th to 1/10th in the moulding side or thickness is allowed for Oak of the South of France (Provence), and of Italy, also for Timber classed 12 in Table B. The dimensions of Pine, Spruce and Birch, to be augmented 1/5th in the moulding side or thickness; this augmentation to be of 1/8th for Pitch Pine, Larch, Hackmatack, or Red Pine. These augmentations to be doubled for all inside planking, such as clamps, thick stuff, bilge strakes, and ceiling; for pitchpine, however, the augmentations may be limited to 1/8 everywhere.

REDUCTIONS AND AUGMENTATIONS. — The above Table gives the principal dimensions for Vessels built of Oak Timber. A reduction from 1/8th to 1/10th in the moulding side or thickness is allowed for Oak of the South of France (Provence), and of Italy, also for Timber classed 12 in Table B. The dimensions of Pine, Spruce and Birch, to be augmented 1/5th in the moulding side or thickness; this augmentation to be of 1/8th for Pitch Pine, Larch, Hackmatack, or Red Pine. These augmentations to be doubled for all inside planking, such as clamps, thick stuff, bilge strakes, and ceiling; for pitchpine however, these augmentations may be limited to 1/8 everywhere.

Table B. — NUMBER OF YEARS ASSIGNED TO TIMBER USED IN SHIPBUILDING.

DESCRIPTION OF TIMBER	KEEL	STEM AND STERNPOST	APRON AND INNER POST	DEADWOODS	KNIGHTHEADS AND HAWSE TIMBERS	FLOORS	FIRST AND SECOND FUTTOCKS	TOPTIMBERS, STANCHIONS AND TRANSOMS	KEELSON	BEAMS AND CARLINGS, HOOKS AND POINTERS	KNEES	WINDLASS AND MAIN-PIECE OF RUDDER	BOTTOM PLANKING	PLANKING FROM BILGE UPWARDS	COVERING BOARDS, WATERWAYS, LOCKS, STRAKES AND SPINDLING	LIMBER STRAKES AND CEILING IN FLAT OF BOTTOM	CEILING AND INSIDE BILGE STRAKES	CLAMPS AND THICKSTUFF

Hemlock . . . . .	0	0	0	0	0	3	3	0	0	0	0	0	3	3	0	0	0	0

Elm, Maple, Birch and Beech may be used for floors in midships for half the length of keel in vessels otherwise entitled, by the present Table, to 9 years: when the vessels are salted these timbers may be used for naval timbers and first futtocks, for the same length as allowed for floors, in vessels otherwise entitled, by the present Table, to 6 years.

American rock elm may be used for inside bilge strakes, in vessels otherwise entitled by the present Table, to 9 years.

Hemlock is not admitted for masts or spars.

\* When salted, will rate 11 years.

Second-hand Timber not to be used in building unless specially authorised by the Committee, who will determine the number of years to which it may be entitled.

In three-deck vessels a reduction of 1/10th in weight will be allowed for the upper deck beam knees.

The vertical arm of the knees may be gradually tapered from the throat bolt to the end, to 1/2 inch less than the tabular thickness at throat bolt.

The intermediate part of staple knees may be 1/2 inch less than thickness at throat bolts

Lodging knees to be at least 3/4ths of the dimensions regulated above.

Breast-hooks and crutches to be 1/2 inch wider than straps; to be square at throat; arms to be 1/4 inch thicker than straps, and to retain the same proportions.

The united length of the arms to be equal in length to half the vessel's beam.

\*\*\* For list of testing machines recognized, see Table H.

The breaking stress is to be applied to 3 links. This test is to be made previous to the application of the Proof stress. The Proof is to be applied to every 15 fathoms length separately.

# CLASSIFICATION

OF

## STEEL AND IRON VESSELS

## ARTICLE 1

## CLASSIFICATION SYMBOLS, ETC.

§ 1. — The degree of confidence placed in a steel or iron vessel is expressed in the **Register** of the **Bureau Veritas** by a **Division** (**I**, **II** or **III**) inserted in the fourth column; and by a **Character** (3/3, 5/6, etc.), inserted in the fifth column.

The **division** to which a vessel belongs, is determined according to the prescriptions of the following Rules and Tables of scantlings.

The **character** 3/3 is given to vessels which are in a complete and efficient condition; the other characters to vessels in a comparatively less suitable and efficient state.

§ 2. — The symbols of classification are completed by a navigation mark followed by two numbers varying from 1 to 3, the first of which indicates the state of the wood portions of the hull; and the second, the state of the masts, spars, rigging, chains, anchors, boats, etc.

Number 1 indicates a very good state, numbers 2 and 3 denote lower degrees of efficiency.

For particulars concerning navigation marks, see Art. 2.

§ 3. — Steel or iron vessels are classed in three **divisions**, which are expressed as follows:

1st division —	<b>I.</b>
2nd >	<b>II.</b>
3rd >	<b>III.</b>

Articles 9 and following determine the methods of construction and minimum scantlings for vessels of the 1st and 2nd divisions; and for machinery.

In the case of vessels for which the 3rd division is desired, the Administration will, on examination of the plans and specifications submitted to them, decide whether such vessels can be so rated.

§ 4. — Vessels which have been built under Special Survey in accordance with the provisions of Article 3, will have the distinctive mark **✱** prefixed to the Division

## ARTICLE 1

### CLASSIFICATION SYMBOLS, ETC.

— 12 —

numeral; which mark will be inserted in the first column of the **Register**, and likewise in the 21<sup>st</sup> and 29<sup>th</sup> column for Steamers the machinery of which has been similarly constructed under special Survey.

§ 5. — Vessels may be classed in one of the three **divisions**, although the requirements of the Rules may not have been altogether complied with, provided that, in the opinion of the Administration they are worthy, on their general merits, of being so classed.

§ 6. — But, on the other hand, vessels, the design or construction of which may be found or considered by the Administration to be objectionable, will be excluded from classification.

The commission mentioned in Art. 8 cannot be admitted in such cases.

§ 7. — To obtain a class, written application must be made to the Surveyor for the district in which the vessel is to be built, from whom the necessary application forms may be obtained.

### SPECIAL SUBDIVISION MARKS.

§ 8. — Steel or iron vessels which are **divided into a sufficient number of watertight compartments** so as to enable them to float in still water with any **one** of these compartments in free communication with the sea

will be inserted in the Register Book with one of the following marks :

- Ⓘ for the first Division,
- Ⓢ for the second Division,
- Ⓜ for the third Division.

Steel and iron vessels which are **divided into a sufficient number of watertight compartments** so as to enable them to float in still water with any **two** of these compartments in free communication with the sea will be inserted in the Register Book with one of the following marks :

- Ⓘ for the first Division,
- Ⓢ for the second Division,
- Ⓜ for the third Division.

To obtain one of these distinctive marks, a **maximum load line** must be submitted for the approval of the Bureau Veritas, also a complete plan of the various compartments showing the several trims together with the calculations of the displacement and of the longitudinal and transverse stability supposing one (or two as the case may be) of the compartments to be filled with water. These documents must be submitted to the Administration for verification

through the Surveyor. The plans of the trimming compartments, piping and pumping arrangements, also detailed plans of bulkheads and their connections, must likewise be submitted. See also Art. 23.

As a basis for calculation the following principles are to be observed. The vessel will be taken floating at her maximum draught in salt water with bunkers full and homogeneous cargo in holds; 60 % of the coal and cargo may be assumed to be buoyant when the holds are flooded. When in this condition, the beams of the deck to which all bulkheads extend at side may not be nearer the water surface at any point than a distance varying from .0022 of the vessels length amidships to .0011 at ends.

If cargo of a greater density than above indicated be usually carried, or if it be of a special nature such as oil, then these circumstances must be duly allowed for in the calculation.

**Sailing vessels** fitted with watertight bulkheads so that each of the masts be in a separate compartment will be entered in the Register with the special mark  $\square$ . (See Art. 23.)

§ 9. — **Vessels having their bow strengthened** in an efficient way as per Art. 24 § 2, in view of navigating through ice, will be entered in the Register with the mark P. R. (Proue renforcée) in the fourth column.

§ 10. — The distinctive classification marks, and in special cases the load line will be entered on the certificate and printed in the Register.

§ 11. — Vessels which have obtained a character previous to the coming into force of the present Rules, may retain their class and distinctive marks in conformity with the former Rules.

§ 12. — The date of build of a vessel to be reckoned from the delivery of the original classification certificate, provided it be issued within six months after launching; but in case it should be issued later than that, the date of build is to be reckoned at six months after the date of launching.

§ 13. — Alterations to the Rules and Regulations for any year, will come into force on the 1st day of July next following the issue of the Rules so altered.

## ARTICLE 2.

### NAVIGATION MARKS.

§ 1. — In the classification of vessels one of the following navigation letters or marks will be assigned :

1° I. (**Inland navigation**). — Vessels specially built to navigate canals and rivers. (See special Rules relating to the building and classification of vessels intended for Inland navigation.)

2° R. (**Roadstead**). — Vessels specially intended for

## ARTICLE 2

### CLASSIFICATION. — SPECIAL SURVEY.

— 14 —

roadstead work. This mark R is also used exclusively for dredgers, hopper barges and the like.

3° P. (**Small Coasting Trade**). — Vessels trading between ports at no great distance from each other.

4° M. (**Mediterranean**). — Vessels specially built for navigation in the Mediterranean Sea.

5° Y. (**Yachts**). — Vessels intended for pleasure sailing.

6° R. (**Rating**). — Sailing yachts intended to receive an international Rating certificate.

7° G. (**Great Coasting Trade**). — Vessels of and above 70 tons, when intended and fit to sail between European ports or along the coasts of the other Continents.

8° Lakes (**Great Lakes**). — Vessels specially intended for service in large fresh water lakes.

9° A. (**Atlantic**). — Vessels intended and fit to cross the Atlantic, Pacific or Indian Ocean, without going beyond Cape Horn and Cape of Good Hope. For this trade, sailing vessels must be above 100 tons gross.

Steam vessels intended for A mark, shall have a bunker capacity sufficient for crossing the Atlantic.

10° L. (**Long Voyages**). — Trade round the world in all seas. For this mark sailing vessels must be above 250 tons gross.

Steam vessels intended for the mark L must be above 900 tons gross tonnage, and be provided with all articles of spare gear prescribed by Art. 35. The coal supply in bunkers and reserve bunkers must be sufficient to steam over a distance of at least 3000 miles.

Before granting a navigation mark, the Surveyor must carefully examine the efficiency, state of repair, and outfit of the vessel.

§ 2. — To obtain one of the above marks, all vessels must be provided with an inventory as required by Art. 35.

For spare gear required for steam vessels see also Art 35.

§ 3. — For the classification and construction of sailing yachts classed R, the requirements of the special rules published by the Administration of the Bureau Veritas are to be followed.

§ 4. — The scantlings and details given in the present Rules do not apply to vessels built for the trade in the Mediterranean sea (M.), for the small coasting trade (P.), for pleasure sailing (Y.) for inland navigation (I.) or for roadstead work (R.). When vessels are to be built for these trades, their specifications and scantlings must be submitted for the approval of the Administration. As a rule an average reduction of 10 to 12 % from the tabular scantlings may be granted to vessels classed

with P or M mark; of 12 to 18 % to vessels classed for roadstead work.

For motor or steam yachts, and for sailing yachts exceeding the dimensions contemplated by the special rules published by the Bureau Veritas and which are not intended to receive the rating mark R, a reduction of about 18 to 20 % will be allowed from the scantlings given in the following Tables for Iron and steel vessels.

For vessels intended for inland navigation (I.) see special rules published by the Administration.

It is to be noted that, when a freeboard certificate is required for vessels with scantlings reduced as allowed above, the freeboard will be determined with reference to these reduced scantlings.

NOTE. — From the first of January 1909 dredgers, hopper barges &c., constructed in accordance with the prescriptions of Art. 37, will be entered in the Register with the navigation mark D, and the description « Dredger », « Hopper Barge » &c. will be inserted in the third column under the name of the vessel.

### ARTICLE 3.

#### CLASSIFICATION OF VESSELS BUILT UNDER SPECIAL SURVEY

§1. — Vessels built under special survey will be inserted in the Register with the mark **+**.

This survey will apply to all parts of the hull, engines and boilers, as well as to the masts, spars, rigging and equipment.

To obtain the mark **+**, all materials used in their construction must be tested according to Art. 33; and for this purpose duplicates of all orders for materials to be tested should be sent to the Surveyor of the district in which the vessel is to be constructed.

The anchors, chains, cables and hawsers of wire or hemp must also be tested and certified as per Art. 35, § 10, at a machine recognized by the Bureau Veritas.

A list of these machines is given in Table 11<sup>1</sup>.

When any important part of the hull or machinery of a vessel being built under special survey, such as the stern frame, rudder frame, shafting and other engine forgings, donkey boilers, &c. is not to be made in the same district as the hull or machinery, the Surveyor of that district must be notified of the place of manufacture in order that arrangements may be made for the supervision and testing of same by another of the Society's Surveyors.

No character will be granted to steam vessels otherwise qualified for the special survey mark, unless their engines and boilers with connections have been surveyed, and their efficiency under ordinary steaming conditions tried and certified by an Engineer Surveyor

## ARTICLE 3

### CLASSIFICATION — SPECIAL SURVEY.

— 16 —

to the Bureau Veritas, or other Engineer authorized by the Administration.

The same applies to sailing ships with donkey boilers fitted on board.

§ 2. — Four sunprints (or a tracing on linen) of each of the principal parts of the hull, machinery, and boilers; including midship, and longitudinal sections, deck plans, and forgings or steel castings; showing fully the method of construction proposed and the scantlings, also the capacity of bunkers and water-ballast compartments, together with complete plans of the pumping arrangements, masts, spars and rigging, must be submitted to the Surveyor for the consideration of the Administration.

For steamers, in addition to the above, plans of the main and donkey boilers, giving the working pressure, heating and grate surface, and the minimum tensile strength of the materials, also plans of the safety valves, must be submitted.

All these plans must contain the data required for the calculations in Article 34.

The Administration will return sunprints of these plans, officially approved with any addition or alteration marked thereon that they may deem necessary.

Any departure from the officially approved plans must receive the sanction of the Administration.

§ 3. — The Surveyor shall supervise the building as often as possible during its entire progress, until the vessel and its outfit are completed.

During these surveys the Surveyor must satisfy himself that the work is carried out in conformity with the approved plans; that the quality of the materials, and the workmanship are good, and that the requirements of the Rules, for the type of vessel, have been fulfilled.

Before any material is put into the work, the Surveyor must verify the marks stamped by the Surveyor who passed it.

He may in doubtful cases test any piece he may wish, notwithstanding that the prescribed tests have been performed. He will have the right to reject any material which may develop flaws before, during, or after its being worked into place.

Double bottoms to be tested, before launching, with a head of water corresponding at least with the load draught of the vessel, and to be perfectly watertight. Peak and deep hold tanks are to be similarly tested. In any case the head of water must be not less than eight feet above the crown of the tank.

§ 4. — The construction and fitting on board of engines and boilers must be carefully inspected by the

Surveyor ; who will be guided by the instructions given in Article 34.

The boilers when finished to be tested by hydraulic pressure to twice the intended working pressure see Art. 34, § 2. But in countries where special regulations for boiler testing are established by law, Surveyors are authorized to conform to such laws.

Main steam pipes to be tested to twice the boiler pressure, and other steam pipes to twice the pressure in the spaces from which steam passes into them.

The surveyor is to ascertain that pipes are so fitted as to provide for easy contraction and expansion.

§ 5. — The Surveyor will inform the interested parties of any faults or defects he may observe during his inspection, and will indicate the necessary alterations without involving the responsibility of the Administration.

If the Surveyor's requirements be not complied with, the Administration reserves the right to refuse the classification of the vessel or to grant her a lower class than stated on the approved plans.

§ 6. — The Surveyors shall be present at the trial of the vessel at sea after her completion, and report upon the efficient working of all machinery, pumps, steering gears, windlass, ground tackle &c.

§ 7. — When the whole work is completed the

Surveyor will transmit to the Administration a full report giving particulars as to type of vessel, dimensions, scantlings, fastenings, quality of materials &c. ; masts, rigging, capacity of bunkers, peaks, ballast tanks, deep tanks, and holds; the number and sizes of the cargo hatches ; lists of the equipment, outfit, and spare gear ; description of the boats, life saving apparatus &c.

The report will also mention the freeboard : and in the case of steamers, the speed on trial.

A similar report shall likewise be furnished, giving a description and full particulars of the engines, boilers, auxiliary machinery, and spare gear.

By authority of the Administration, the Surveyor will deliver to those interested the certificate of classification ; and the class of the vessel will then be published in the Register or its Supplements.

#### ARTICLE 4.

##### CLASSIFICATION OF VESSELS NOT BUILT UNDER SPECIAL SURVEY.

§ 1. — Plans, including a midshipsection and longitudinal plan, showing as fully as possible the scantlings and construction are to be submitted for the approval of the Administration.

§ 2. — In the case of vessels in course of construc-

## ARTICLES 4 AND 5

### CLASSIFICATION — PERIODICAL AND ANNUAL SURVEYS.

tion, the Surveyor shall superintend the building as may be necessary, during its progress, until the vessel and outfit are complete.

§ 3. — The general conditions and requirements of §§ 4 & 5 of the previous Article will also be applicable in all cases coming within the scope of the present Article.

§ 4. — If the vessel be already built when put forward for classification, a complete Survey must be held in accordance with the requirements of Article 6; and in the case of steamers coming within this category their Engines and Boilers must also be surveyed and tested as required by that Article.

The Surveyor will forward to the Administration a report as complete as possible upon the construction and condition of the hull and machinery together with plans as above mentioned.

The Administration may require that this survey be held by two Surveyors.

By authority of the Administration the Surveyor will deliver to those interested the Certificate of Classification; and the class of the vessel will be published in the Register and Supplements.

— 18 —

## ARTICLE 5.

### MAINTENANCE OF CLASS. PERIODICAL AND ANNUAL SURVEYS.

§ 1. — In order to retain their distinctive characters, steel or iron vessels must be subjected to the inspection of a Surveyor to the Bureau Veritas at the following periods:

Vessels of the 1st division, every **4 years**.

Vessels of the 2nd division, every **3 years**.

Vessels of the 3rd division, every **3 years**.

§ 2. — At the expiration of these periods, the character will be withdrawn, unless the vessel be subjected to the Survey prescribed by Art. 6.

New Certificates of Classification will be issued after each of these surveys.

This survey may, if desired, take place before the prescribed period.

§ 3. — All vessels should also be examined in dry dock once a year, or as near that time as possible, and their engines and boilers surveyed; these surveys are described in Art. 6.

Auxiliary machinery and boilers in sailing vessels should likewise be examined every year or as near that time as possible.

Annual Surveys will be recorded on the Classification Certificate by the Surveyor, and will be duly reported in the Register and Supplements.

## ARTICLES 5 AND 6

### ANNUAL AND PERIODICAL SURVEYS GENERAL AS TO SURVEYS.

§ 4. -- In screw steamers the propeller and propeller shaft are to be surveyed at least every two years.

§ 5. — In case of stranding or damage to hull or machinery (the class having lapsed in consequence of the accident) the owners or their agent must notify the Veritas Surveyor, in order to have the vessel surveyed. This notification must be sent in time to allow the Surveyor to ascertain the nature and extent of the necessary repairs which must be satisfactorily executed under his inspection.

When the repairs have been completed, the Surveyor will endorse the certificate, which then resumes its original value.

When the vessel enters a port not situated in the district of a Veritas Surveyor, a copy of the official survey report must be sent to the Administration, and the vessel afterwards surveyed at the first Port where the Bureau Veritas is represented.

When this is not attended to the class will be withdrawn.

§ 6. — The Surveyors must be notified whenever the boilers or the screw propeller or the tail shaft of a vessel classed in Veritas are removed, and in all cases when repairs of any importance are being made to the machinery.

When boilers have undergone important repairs, they must be tested by hydraulic pressure, to one and a half times the working pressure. (See Art. 34.)

§ 7. — No structural alterations are to be made to a classed vessel, its engines, or boilers, unless the plans have been submitted and approved by the Administration. Alterations, when allowed, must be made under the inspection of a Surveyor to the Bureau Veritas and reported upon by him.

§ 8. — When a vessel takes a lower division than the one originally obtained, she must be surveyed according to the Rules applying to the lower division.

§ 9. — The Surveyors to have free access at all times to examine the vessels and their machinery.

When a vessel is not kept in an efficient state of repair, the class may be withdrawn.

§ 10. — When a vessel's class is withdrawn, the fact will be duly published in the Register or Supplements.

Vessels whose class has expired may be retained in the Register without a character.

## ARTICLE 6.

### GENERAL AS TO ANNUAL AND PERIODICAL SURVEYS. ANNUAL SURVEY.

§ 1. — All steel or iron vessels should be examined in dry dock at least once a year, or as near to that time as possible, and coated as may required. In the case of new

## ARTICLE 6

### GENERAL AS TO ANNUAL AND PERIODICAL SURVEYS.

vessels a survey in dry dock will be obligatory within one year from date of launching.

§ 2. — Engines and boilers should be surveyed every year or as near to that time as possible, but not exceeding 18 months.

The Surveyor will examine them completely and may require the opening up of the engines and boilers, and if desirable the drilling of plates, to such an extent as may be necessary for examination to enable him to certify that they are in efficient working order.

When it is intended to open up any parts of the machinery, the Surveyor is to be called upon to examine the parts exposed.

### PERIODICAL SURVEYS.

§ 3. — The following are the principal requirements for survey under Article 4, § 4, and Article 5, § 1.

The vessel must be placed in dry dock, or on a slipway, upon blocks of sufficient height, and staging erected, to facilitate a complete examination being made.

The holds and peaks must be cleared; the limber boards, and such other parts of the ceiling as the Surveyor may require, are to be lifted; and holes drilled wherever he may consider necessary.

The whole of the steel and iron work, both inside and

— 20 —

outside, must be cleaned, and all oxidation removed, and the whole coated with oil paint or other approved composition.

Bunkers of steamships must be cleared of coal, the ceiling lifted, and the framework and seating under engines and boilers exposed as far as practicable.

Decks, hatches, bulkheads, peaks, in fact every part of the vessel, masts, spars, rigging, ventilators, pumps, piping, sluice valves &c., anchors, chains and outfit must be carefully examined and reported on.

All steel or iron parts of the vessel, and wood decks, which have suffered from ordinary wear, deterioration, or other causes, and which, on examination by boring, or otherwise, are found to have less than three-fourths of the thickness required by the Tables for a new vessel of the same dimensions, must be removed and replaced by new material of the required dimensions and quality.

As regards anchors, chain-cables, rigging, etc., they must be replaced when their sectional area or weight is reduced to 75 % of its tabular value.

Double bottoms are to be opened up and cleaned out, as may be required, to facilitate internal examination by the Surveyor; and all ceiling having been removed from and in way of same, each compartment is to be separately tested by water, under a head corresponding at least with the load-line of the vessel.

Peak, and deep hold tanks are to be similarly dealt with. In any case the head of water must not be less than eight feet above the crown of the tank.

The steering gears, as also all parts of the rudder and steering appliances and connections, must be opened out so as to allow of complete and thorough examination. If the Surveyor should deem it necessary the rudder must be lifted.

In vessels fitted with insulated holds for the carriage of frozen cargoes, the hatches at the bilges must be lifted, also as much of the insulation removed as will satisfy the Surveyor that the structural ironwork behind same is in good order.

In addition to the above, the whole of the ceiling must be lifted at least once every twelve years in vessels of the first Division, and once every nine years in vessels of the second or third Division, to ascertain the state of the steel or iron parts of the bottom, cement, etc., inside; but in special cases, this may be postponed with the sanction of the Administration on the report of the Surveyor.

§ 4. — All defects discovered are to be rectified, and necessary repairs fully carried out, under the direction and to the satisfaction of the Surveyor.

The engines and boilers of steam vessels must be

submitted to a complete survey at the periods prescribed by Art. 5, § 1.

The Surveyor must examine the following parts in order to ascertain that they are in good working order: the cylinders, pistons, and valves; the condenser, the air, circulating, feed, and bilge pumps; the main bearings, crank pins, tunnel shafting, propeller shaft, propeller fixing, and the stern bushes. When the vessel is in dry dock, all the sea connections are also to be carefully examined.

The propeller shaft is to be examined every two years or as near that time as possible.

The Surveyor will examine the general arrangement of the valves, cocks and piping, and satisfy himself that the requirements of the Rules are carried out and especially that the donkey steam pump can efficiently pump from the bottom of all compartments (See Art. 23<sup>A</sup> and Art. 34, § 10). The prescription of Art. 34, § 10 hereafter, with regard to the possibility of running sea water into the vessel, accidentally, or otherwise, must not be overlooked, viz :

That when there is a bilge suction valve connected with the circulating pump, it shall be fitted as a non-return valve.

§ 5. — The interior and the exterior of the boilers and superheaters must be carefully examined, and the

## ARTICLES 6 AND 7

### PERIODICAL SURVEYS — CERTIFICATES AND SURVEY FEES.

Surveyor must see that the load on the safety valves is in accordance with the thickness of the plating, the system of riveting, and the general condition of the boilers.

§ 6. — The boilers must be tested by hydraulic pressure in accordance with the prescriptions of Art. 34, § 5; after twelve years this test to be made every two years.

§ 7. — All parts of engines and boilers funnels &c. worn out to less than 75 % of their original thickness or sectional area must be taken out and replaced. This does not apply to shafts, which are to be renewed whenever the surveyor considers it necessary.

All repairs and renewals must be fully carried out under the direction and to the satisfaction of the Surveyor.

§ 8. — On the completion of the annual and periodical surveys, the Surveyor will forward a detailed report to the Administration.

Annual and periodical Surveys will be recorded on the Classification Certificates and duly reported in the Register and Supplements.

— 22 —

## ARTICLE 7.

### CLASSIFICATION CERTIFICATES AND SURVEY FEES

§ 1. — Vessels which have been accepted by the Administration for one or other of the classes above described shall receive a Classification Certificate.

Steamers shall receive one certificate for the hull, and one for the engines and main boilers; an additional certificate will be given for the donkey boiler.

Sailing Vessels fitted with a donkey boiler for working winches, etc., will receive a certificate for such boiler.

§ 2. — The Bureau Veritas Surveyors shall endorse these certificates whenever a survey has been held, such as annual survey of hull or auxiliary machinery referred to in Article 5, survey of engines or boilers or survey after damage, as mentioned in § 8 of the preceding Article.

§ 3. — New Classification Certificates shall be issued upon the completion of the periodical surveys referred to in Art. 5, § 1.

§ 4. — Shipowners and others interested should note that the Surveyors are not at liberty to deliver or endorse certificates of classification for hull, engines and boilers or those for anchors, chains, hawsers, etc., until the survey fees and expenses have been paid, also fees and

expenses in connection with the testing of materials; and that until this is done no information as to the survey will be published in the Register or Supplements.

§ 5. — When plans of a vessel are submitted for approval, it is understood that a charge may be made in proportion to the work spent upon their consideration, whether the classification of the vessel be proceeded with or not.

§ 6. — A fee will likewise be exigible whenever application is made for survey with a view to classification, irrespective of what may be the result of such application.

## ARTICLE 8.

### ARBITRATIONS.

§ 1. — In case of disagreement between the owners or builders and the Surveyors, in relation to vessels already classed or entered for classification and in course of construction, as to the material, workmanship, extent of

repairs or application of the Rules, the Administration will, on application being made, send another Surveyor whose decision shall be final; or, if preferred, the dispute may be referred to a commission composed of two arbitrators, one to be selected by each party, and should they disagree, an umpire may be appointed by them or by the chairman of the Tribunal or Chamber of Commerce, at the request of either party.

§ 2. — The Rules being the basis on which all vessels are classed in the Veritas Register, the decision of the commission must be grounded on the Rules, and the decision will be without appeal.

§ 3. — It is to be understood that the payment of the survey fees and expenses shall constitute the only claim that can be recovered from the party which fails.

§ 4. — Whether the vessel be classed or not, the survey fees and expenses become due when the Surveyor has been formally requested to survey the vessel.

§ 5. — The above mentioned commission cannot be admitted in cases covered by Art. 1, § 6.

## RULES

FOR THE

## BUILDING OF STEEL AND IRON VESSELS

## ARTICLE 9.

## PRINCIPAL DIMENSIONS. — SCANTLINGS.

The principal dimensions of vessels, hereinafter referred to, shall be determined in the following manner, viz.: —

## LENGTH.

§ 1. — The **length** to be taken from the after side of the stem to the fore side of the sternpost (rudderpost in screw steamers), measured **on the line of the upper deck** in vessels having one or two decks, and **on the second deck** in vessels having more than two decks.

Where the upper part of the stem forms a cutwater, the length is to be measured from the intersection of the after edge of the stem continued from the straight part below the spring of the curve, with the line of the upper deck.

## BREADTH.

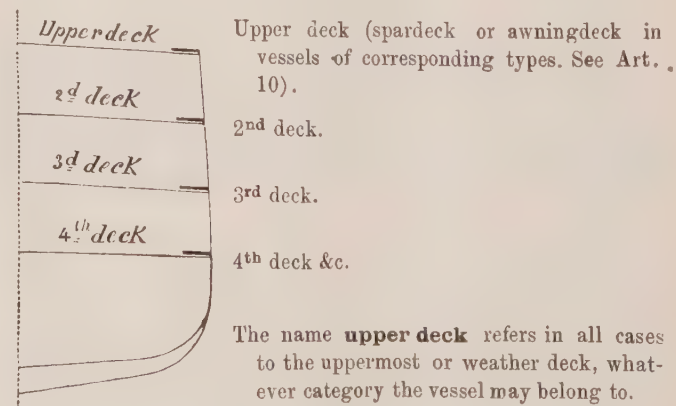

§ 2. — The **breadth** to be the **breadth moulded**, i. e. taken outside the main frame at the widest part of the vessel.

## DEPTH.

§ 3. — The **depth** employed in all cases to be the **moulded depth**, i. e. the depth measured **from the top of keel to the top of the upper deck beam at side and at mid-length**, unless otherwise specified in Art. 10 or in Art. 16, § 4.

## NAME OF DECKS.

§ 4. — In the present Rules, the different decks or tiers of beams of a vessel are always distinguished as indicated in the accompanying sketch :

## EXTREME PROPORTIONS.

§ 5. — Vessels whose length exceeds 12 times their depth or 7 times their beam, are to be treated as vessels of extreme proportions, and be subject to the additions mentioned in Art. 32.

## SCANTLINGS.

§ 6. — The **minimum** scantlings allowed for steel and iron vessels are laid down in Tables annexed to the present Rules. The Tables for steel are printed on pink paper, those for iron on blue paper.

Sections of strength equivalent to tabular requirements, such as the normal profiles recognised in different countries, may be accepted with the approval of the Administration.

For the quality and tests of the materials, see Art. 33.

When determining the scantlings, the exceptions specified in Art. 10 and the additions required by Art. 32 are to be taken into account.

The Administration moreover claim the right of increasing the said scantlings for any vessel liable, through her proportions, high propelling power or other special features of design, to sustain unusual strains.

The Tables for scantlings are to be used as follows, viz.:

The scantlings given in Tables Nos 1, 3 and 4 are deter-

mined by the product of length by breadth by depth ( $L \times B \times D$ ); measured as indicated in §§ 1, 2 & 3.

The scantlings given in Tables No 2 are determined by adding the breadth to the depth ( $B + D$ ) measured as indicated in §§ 2 & 3.

When the numerals thus found fall between two numbers in the Tables, the scantlings may be regulated by the lower numeral.

§ 7. — Details not specified in the Rules are to be approved by the Surveyors.

## ARTICLE 10.

## DIFFERENT TYPES OF VESSELS. — GENERAL REGULATIONS.

§ 1. — Steel and iron vessels belong to one of the following types :

1° **Vessels with one, two or three decks.** This category includes all vessels having their upper deck running from forward to aft without any interruption, and not belonging to the spardeck or awningdeck type.

For special regulations see §§ 2 and 3, hereafter.

Forecastles, poops or bridgehouses may be erected on the upper deck of vessels having one, two, or three decks. For the scantlings of these superstructures see § 8 hereafter.

2° **VESSELS WITH A RAISED DECK.** — In these vessels the upper deck is interrupted and raised at the after end,

the forward part of the deck being fitted with a forecastle built in the ordinary manner, or raised in the same manner as the quarterdeck. See §§ 4 and 8 hereafter.

3° **VESSELS OF THE WELLDECK TYPE.** — When the poop or raised quarterdeck is connected with the bridgehouse, the forecastle being a topgallant or a sunk forecastle, so that the upper deck is exposed only between the fore-castle and the bridgehouse, the vessel belongs to this type, and §§ 2, 3 & 8 hereafter are to be applied according to circumstances.

4° **SPARDECK VESSELS.** — These vessels which are intended for taking light cargoes in the upper 'tween deck, must have at least two laid decks, and only light deck erections. They may benefit by the reductions allowed in § 5 hereafter.

5° **AWNINGDECK (OR HURRICANEDECK) VESSELS.** — In these vessels a light deck is fitted over the second deck from forward to aft, to shelter passengers or light cargo. The scantlings of these vessels may benefit by the reductions allowed in § 6 hereafter.

If the topsides between the awningdeck and the second deck are left open for a certain length before and abaft the midship part, or for the whole length of the vessel, she is to be termed a **Shadedeck** vessel.

**Partial awningdeck** vessels are those where the awning-deck is not continuous from forward to aft, and which

have a raised after or forward deck; § 6 applies to both cases.

6° **SHELTER-DECK VESSELS.** — These are vessels having, as in the case of awning deck vessels, a complete superstructure, in the deck of which (the shelter-deck) are one or more openings at the middle line which are not fitted with means whereby they may be permanently closed.

7° **TURRET VESSELS.** — Are those without sheer having a continuous central turret which is constructed so as to form with the main or harbour deck an integral part of the hull. The normal breadth of this erection shall be taken at half the breadth of the ship, and its normal height shall be reckoned at 25 % of the moulded depth to harbour deck. They may have usual erections such as poop, fore-castle etc. on turret deck. In such vessels the framing and shellplating must be continuous up to turret deck stringer, and should be rounded above the load line and at base of turret. (See sketch.)

8° **TRUNK DECK VESSELS.** — Are those having a continuous trunk erection amidships extending over at least 70 % of the vessels length. This trunk to be of strong construction well connected to an iron or steel deck, and to be without openings in its sides. Its breadth shall be not less than 45 % of the moulded breadth of the vessel and depth not less than 3 ft. 6 ins.

VESSELS WITH ONE, TWO OR  
THREE DECKS.

The above types of vessels are to be treated in accordance with the following paragraphs.

## I. — VESSELS WITH ONE, TWO OR THREE DECKS.

§ 2. MEASURING OF DEPTH. — The depth in vessels of this class is to be measured in the following manner :

## A. SINGLE DECK VESSELS.

In all vessels having only one laid deck, with or without a second tier of beams, the depth for regulating the scantling numbers is to be measured **to the upper deck**. (See Art. 9, § 3.)

## B. TWO AND THREE-DECKED VESSELS.

In steam vessels classed with the navigation mark L, having two or more tiers of beams and at least two laid decks, one of which is of steel or iron, the depth regulating the **longitudinal** number may be 85 % of the moulded depth.

In steam vessels classed with the navigation mark G, having two or more decks laid, one of which is of steel or iron, the depth regulating the **longitudinal** numeral may be 75 % of the moulded depth.

The above reductions will also be allowed for **three deck steam vessels** when hold beams are dispensed with and compensated for by web frames or deep framing. (Art. 16, §§ 13, 16.)

For sailing vessels no reduction in the tabular depth will be granted unless the third tier of beams is fitted.

§ 3. GENERAL RULES APPLYING TO VESSELS WITH ONE, TWO OR THREE DECKS. — Steam vessels may be constructed with decks, strong hold beams and stringers as indicated on Plate A. The hold beams and stringers, or the lower decks may be dispensed with and compensated for by web frames and stringers as per Plates B<sub>1</sub> B<sub>2</sub> or by deep framing and stringers as per Plates C<sub>1</sub> C<sub>2</sub>. (See Art. 16.)

For all particulars about riveting, see Art. 27.

All frames to extend to the upper deck stringer plate, and the reverse frames according to Article 14.

The dimensions of the beams are given in Tables N° 5, but any other form approved by the Administration may be substituted.

The sheerstrake to be fitted at the upper deck.

The dimensions of the stringers, longitudinal and diagonal tie plates and stringer angle bars, are given in Tables N° 6. These dimensions to be retained for half the vessel's length amidships; beyond this and towards the ends of the vessel they may be gradually reduced to the dimensions given in the Tables. (See also Art. 18 and 19.)

In vessels of the two and three deck type, having **22 feet depth or more**, measured to the upper deck, the upper and second deck must be entirely plated over or covered with

## ARTICLE 10

### RAISED DECK AND WELL-DECK VESSELS.

wood. (See also Art. 22.) The thickness of wood decks is given in Tables N° 6.

When plated decks are required by the Rules, they are to be in accordance with Tables N° 6.

When a complete or partial plated deck is required, it must be fitted to the upper deck. (See Art. 22.)

Where one complete deck and one partially plated deck are required, the complete plating must be fitted on the upper deck and the partial one on the second deck.

Where two steel decks are required by Table N° 6, and the lower one is suppressed, the thickness of the upper, between the hatches and stringer plate, shall be increased by 50 %, and the stringer plate and plating between the hatches by 25 %. Similar compensation is to be made for the suppression of a lower deck in cases where more than two decks are required.

In all vessels of this class the dimensions of the deck stringers will be determined by the proportion of length to depth measured to the upper deck.

Side intercostal keelsons will be required in all cases in three-decked vessels for not less than  $\frac{2}{3}$ ds the vessel's length amidships. (See Art. 17, § 6.)

If it is intended to erect houses other than those of limited dimensions on the upper deck of three-decked vessels partial bulkheads must be fitted between decks, or

— 28 —

other compensation given and submitted through the resident Surveyor for the approval of the Administration.

The additions for extreme proportion requirements are given in Art. 32, and will be determined by the proportion of length to depth measured to the upper deck.

### II. — RAISED DECK AND WELL-DECK VESSELS.

§ 4. MEASURING OF DEPTH. — The scantlings to be regulated by the depth to the upper deck amidships, and the height above the line of upper deck is to be added to the moulded depth (See Art. 16) for the arrangement of lower deck beams, hold stringers and reverse frames in way of the raised deck, unless compensation is given.

For vessels built with both a raised quarter and raised foredeck, a maximum load line must be submitted for the approval of the Administration.

#### GENERAL RULES FOR BUILDING VESSELS WITH A RAISED DECK.

— For all particulars about riveting, see Article 27.

The scantlings of beams, stringers, longitudinal and diagonal tie plates of raised decks to be the same as those required for the upper deck, and the thickness of the raised deck side plating above the main sheerstrake to be the same as required for the side shell plating. The wood deck may be reduced  $\frac{1}{2}$  inch in thickness, when the length of the raised deck does not exceed  $\frac{1}{4}$ th of the

vessel's length, but no deck plank under  $2\frac{1}{2}$  inches in thickness will be allowed. The end bulkhead plates of raised decks to be the same in thickness as the side plating and connected to the deck at their lower edge by bars of stringer angle dimensions.

In way of a break, both the raised deck and the main deck shall be plated over from stringer to stringer, for a length equal to one beam space, in order to afford efficient means of attachment for brackets fitted between the main and raised parts of the deck. A plan of the strengthenings must be submitted to the Administration for approval.

The side plating to be continued beyond the break for a length equal to two or three spaces of frames.

**Whenever the length of the raised deck exceeds one-quarter of the vessel's length**, the side plates at the break must be increased  $\frac{2}{16}$ ths of an inch in thickness, and the adjoining plates before and abaft it  $\frac{1}{16}$ th of an inch. (See also § 8 hereafter.)

Where ports or gangways interfere with this arrangement, the sheerstrake must be doubled for a length of at least twenty feet, in way of the break.

The raised deck stringer is to be continued beyond the break for a length equal to three spaces of frames, or otherwise compensated for, but its width may be gradually reduced to that of the main rail. (See also § 8 hereafter.)

The upper deck stringer must also extend beyond the break bulkheads for a length of three frame spaces. The stringers to be connected to the side plating by angle bars.

**In vessels having both a raised quarter and a raised foredeck**, the upper deck sheerstrake must extend continuously from stem to stern, and be increased  $\frac{2}{16}$ ths of an inch in thickness at each break, but may be gradually reduced at each end of the vessel as usual.

The upper deck stringer must be continued under the raised deck for a length equal to three times its width; it must be fitted to the side plating or sheerstrake, and connected to it by angle bars extending from frame to frame; the stringer may be gradually reduced in breadth until the width of the frames is attained.

The raised deck stringer must be continued without interruption and connected to the side plating by an angle bar, but its breadth may be reduced provided it is compensated for.

The stringer plate of the deck below the raised deck must also be continued for three frame spaces beyond the break, and fitted as just described. Other systems of compensation will be accepted, provided the plans be submitted through the Surveyor for the approval of the Administration.

No doors will be allowed in the fore end bulkheads of bridgehouses nor in the end bulkhead plates of raised

## SPARDECK VESSELS.

— 30 —

decks. These bulkheads must be efficiently strengthened and connected to the upper deck.

All the frames in the bridgehouses of such vessels must extend to the upper stringer plate.

In vessels of the welldack type the freeing port area in the well to be in accordance with Art. 22, § 3, and the bulkhead at the fore end of the bridge is to be stiffened as follows : —

The thickness of the plating to be as given in Table N° 8 for the side plating of bridgehouses having 40 % of the vessel's length; coaming plates to be  $\frac{2}{32}$  in. thicker. Bulb angle stiffeners spaced 30 ins. apart are to be fitted, and connected by knee plates to deck plating both at the main and the bridge decks.

The following table gives the scantlings of the bulb angle stiffeners.

BREADTH OF SHIP	SCANTLINGS OF STIFFENER	BREADTH OF SHIP	SCANTLINGS OF STIFFENER
24	5 3 $\frac{15}{32}$	40	7 $\frac{1}{2}$ 3 $\frac{1}{2}$ $\frac{15}{32}$
30	6 3 $\frac{15}{32}$	50	8 $\frac{1}{2}$ 4 $\frac{1}{2}$ $\frac{15}{32}$
36	7 3 $\frac{15}{32}$	60	8 $\frac{1}{2}$ 5 $\frac{1}{2}$ $\frac{15}{32}$
42	7 3 $\frac{15}{32}$	58 and above	9 3 $\frac{15}{32}$

Intermediate sizes to be found by interpolation.

At about the height of the main rail, horizontal

brackets or gusset plates of the thickness of bridge front coannings are to be fitted so as to connect the bridge front with the bulwarks on each side of the vessel.

Arrangements, equivalent in strength to the above, will be accepted with the approval of the Administration.

## III. — SPARDECK VESSELS.

§ 5. MEASURING OF THE DEPTH. — The scantlings may be regulated by measuring the moulded depth **to the second deck**, but the numbers thus obtained are in no case to be less than 77500 and 45.

Spardeck vessels may benefit by the reductions allowed hereafter.

The scantlings and riveting of "strong spardeck" vessels whose load draught is practically the same as that of a three decker shall be considered with reference to the three deck rather than spardeck requirements.

SPECIAL RULES FOR BUILDING SPARDECK VESSELS. — For all particulars about riveting, see Art. 27.

The reverse frames must extend to the upper and above the second deck stringer alternately.

If it is intended to erect other houses on the spardeck than those of limited dimensions, partial bulkheads must be fitted between decks, or any other compensation given and submitted through the resident Surveyor for the approval of the Administration.

In vessels the numeral of which is under 187500 and having only light deckhouses, the partial bulkheads may be replaced by carrying all reverse frames up to the spardeck for at least the length over which the deckhouse extends.

A sketch of cargo ports in tween decks, showing compensation, shall be submitted for the approval of the Administration.

The dimensions of the beams are given in Tables N° 5, but any other approved form may be substituted.

Sheerstrakes according to Tables N° 1 to be fitted to both spar and second decks. The thickness of topside plating between the spar and second deck sheerstrakes is given in Tables N° 1, but the end thickness of these plates on vessels fitted with a full poop or topgallant forecastle to be in no case less than the tabular thickness of said fore-castle or poop side plating.

It is recommended to increase the thickness of this topside strake by about  $2/32$  in., a corresponding amount being taken from the main deck sheerstrake.

The upper and second decks must be permanently plated over or covered with wood. (See also Art. 22.) A reduction of half an inch from the tabular thickness will be allowed on the deck planks of the upper and second deck, but no planking under 3 inches will be allowed when no plated deck is fitted.

Plated decks to be fitted in accordance with Tables N° 6.

When a complete or partial plated deck is required, it must be fitted on the upper deck. (See Article 22.)

Where one complete deck and one partially plated deck are required, the complete plating must be fitted on the upper deck, and the partial one on the deck immediately under it.

Side intercostal keelsons will be required **in all cases** in these vessels, for  $2/3$ ds the vessel's length amidships. (See Art. 17, § 6.)

Stringer plates and tie plates of the dimensions given in Tables N° 6 to be riveted on each tier of beams and fitted according to Articles 18 and 19.

The dimensions of the deck stringers to be determined by the proportion of length to moulded depth measured **to the upper deck**.

**In vessels whose length is under 14 times the moulded depth** measured to the upper deck, a reduction of  $1/16$ th of an inch will be allowed on the thickness of the stringers, longitudinal and diagonal ties of the main deck ; but none of these plates to be under  $11/32$ ds of an inch amidships, and  $10/32$ ds at the ends when of steel ( $7/16$ ths and  $6/16$ ths when of iron).

The above reductions are not to be applied to stringer angles.

## ARTICLE 10

### AWNINGDECK AND SHELTERDECK VESSELS

— 32 —

In vessels whose length is 14 depths and above measured to the upper deck no reduction will be allowed on the thickness of stringers, longitudinal and diagonal ties.

The augmentations for extreme proportion are given in Article 32, the depth being taken to the upper deck, both for the upper and the lower parts of the vessel.

#### IV. — AWNINGDECK AND SHELTERDECK VESSELS.

§ 6. MEASURING OF DEPTH. — The depth for scantlings as well as for extreme proportions to be measured **to the second deck**; but for the longitudinal numeral in vessels having two or more laid decks below the awning deck the depth may be taken at 85 % of the moulded depth.

**RULES FOR BUILDING AWNINGDECK VESSELS.** — For all particulars about riveting see Art. 27.

For these types of vessels, **a maximum load line must be submitted for the approval of the Administration** and entered in the Register book.

**The hatchways and openings on the second deck** must be fitted in every respect as if it were an exposed deck, but the depth of coamings need not exceed 12 ins.

All frames must be carried up to the awning or shelter deck stringer plate, or to the lower part of the curved gunwale plate.

All reverse frames must be carried up to the top of the

second deck stringer angles. They shall extend to the awningdeck stringer on every fourth frame when the longitudinal number is 270000 or above, and on every second frame when of or above 450000.

The dimensions of awning or shelter deck beams are given in Tables N° 5, but any other approved form may be substituted. The beams must in all cases be efficiently riveted to the frames, to the satisfaction of the Surveyor.

The thickness of the side plating, between the awning or shelter and second deck sheerstrakes is given in Tables N° 1.

The awning or shelter deck sheerstrake in all cases to be 1/16th of an inch thicker than the side plating next below it.

Openings, such as cargo doors, in the awning or shelter deck side plating must be efficiently compensated for, and a sketch of the proposed arrangements submitted for the approval of the Administration.

For the reduction of side plating at ends see Table N° 1<sup>5</sup>.

The scantlings of awning and shelter deck vessels whose longitudinal number exceeds 750000 will be specially considered.

The breadth and thickness of stringers and ties are given in Tables N° 6. The tabular breadth is to be retained for half the vessel's length amidships, tapering off

gradually towards the ends to the dimensions shown in the Tables. When the gunwale plate is curved, the stringer must be laid flat on the beams for its full tabular breadth.

Tie plates and diagonals must be fitted on the awning or shelter deck and deck below, where not plated.

The stringer angles to be as given in Tables N° 6 for lower decks.

The second and upper decks must be plated or covered with wood.

A reduction of one-fourth from the thickness of second deck planking will be allowed for the awning or shelter deck, but no planking under  $2\frac{1}{2}$  inches thick is to be fitted.

Plated decks will be required in accordance with the requirements of Tables N° 6.

When a partial or a complete plated deck is required, it must be fitted on the second deck. (See Art. 22.)

When more than one plated deck is required by Tables N° 6, the thinnest of the decks so required shall be fitted to the awning or shelter deck.

Intercostal sister or side keelsons are to be fitted in vessels over 32 feet in breadth or 275 feet in length. (See Art. 17, § 6.)

Vessels whose depth to the top of the second deck beams is over 25 feet, to have a bulb of the same dimensions as

required for second deck beams, riveted between the bilge keelson angle bars, for  $\frac{2}{3}$  of the vessel's length amidships.

If any erection is intended to be constructed on the awning or shelter deck, the proposals for same and suggested additional strengthening must be submitted for approval to the Administration through the resident Surveyor.

The additions for extreme proportion requirements, are given in Article 32, the depth for the ratio of length to depth being taken to the second deck.

#### V. — TURRET-DECK VESSELS.

§ 7. — MEASURING OF DEPTH. — The depth for Tables Nos 1, 2, 3 & 4 may be 60 % of the moulded depth to harbour-deck, except in vessels whose moulded depth exceeds 19 feet, in which case the depth for Tables Nos 2 & 4, shall be seven feet less than the moulded depth to harbour deck. (70 % shall be taken instead of 60 % in the case of vessels having no hold beams.)

RULES FOR BUILDING TURRET VESSELS. — All the frames and reverse frames must extend to turret deck, or equivalent strengthening fitted.

If deep frames be adopted, their scantlings must be determined as in Art. 16, § 17. They may terminate at the harbour deck, and the upper limb be formed of bulb angle

## ARTICLE 10

### TURRET-DECK VESSELS

— 34 —

of the size given in the last column of Table N° 5<sup>1</sup> for upper deck beams whose length equals 80 % of the moulded breadth.

Turret deck beams must be of the size given in last column of Table N° 5<sup>1</sup> for beams whose length equals 80 % of the moulded breadth of the ship. They are to be fitted on alternate frames, and on every frame under winches. At ends of hatches a strong beam is to be fitted.

Harbour deck beams to be fitted on every alternate frame, of the size given in Table N° 5 for beams whose length equals 80 % of the moulded breadth of the ship. Instead of beams on every second frame, heavy beams of double channels or other equivalent section may be fitted at the ends of hatches and elsewhere, not exceeding, as a rule, 12 frame spaces apart. If of double channels their scantlings shall be as given in column 3 of Table N° 5<sup>4</sup> for beams whose length equals 80 % of the moulded breadth of the vessel. They should be fitted with covering plates top and bottom, and must be supported by suitably constructed pillars of double channels or other section, placed in line with, or efficiently supporting the sides of the turret.

The arrangement of beams and stringers below the harbour deck must be in accordance with Art. 17 & 18, noting that if it be desired to modify or suppress any of the requirements therein set forth, adequate com-

pensation is to be provided to the satisfaction of the Administration.

Strong hold beams are to be in accordance with the requirements of Table N° 5<sup>4</sup> and are to be well connected with the channel pillars referred to above. The ends of these beams must be well connected to the hold stringer and framing by means of large bracket plates. In some cases the stringer and bracket plates shall be connected to the shell by double angles.

A stringer plate of width equal to  $1\frac{1}{2}$  ins for every 10 feet in length of ship and of same thickness as sheerstrake must be fitted on the turret deck beams with a stringer angle of the size given in Tables N° 6 or equivalent.

The scantlings of lower deck stringer and plates and bars to be as given in Tables N° 6 for third decks.

If more than one deck be required to be plated, according to Tables N° 6, and such plated lower decks are not fitted, adequate compensation will be required.

The thickness of shell plating must be in accordance with Tables N° 1. The sheerstrake is to be fitted at the turret deck.

Additions for extreme proportions will be required according to Art. 32; these additions to be regulated by the proportion of length to depth moulded to harbour deck plus one-third of the height of turret.

For those items or arrangements of parts not specifi-

POOPS, FORECASTLES, BRIDGEHOUSES  
AND DECKHOUSES.

cally referred to above, the general requirements of the rules will be taken as a basis.

The equipment is to be regulated by the product of length, breadth and depth to harbour deck, plus half the capacity of turret and of deck erections, the usual reduction for full-powered steam-vessels being allowed.

POOPS, FORECASTLES, BRIDGEHOUSES  
AND DECKHOUSES.

§ 8. — The scantlings of side plating etc. of poops, bridges, forecastles and deck houses are to be in accordance with Table N° 8.

In poops the side plating is to be continued forward of the front for a length equal to two or three spaces of frames, and the plates covering the break to be increased 1/16th of an inch in thickness. In bridgehouses these requirements to be applied to both ends of the house.

For the riveting of butts, see Art. 27.

The transverse bulkheads enclosing poops, forecastles and bridgehouses are to be plated with plates of the same thickness as the side plating of poops and bridgehouses and must be strengthened by vertical frame angle bars, web plates or bulbs, not more than 30 inches apart, and connected with efficient knee plates at top and bottom.

For the stiffening of the bulkhead at the fore end of bridgehouse in well-deck vessels see § 4 of this Article.

When the length of the poop, bridgehouse or forecastle **exceeds one-quarter of the vessel's length**, the sheerstrake is to be doubled and the thickness of stringerplate is to be increased by 20 % **for a length of at least twenty feet** in way of the front of the poop or of both ends of the bridgehouse, or of the after end of the forecastle. (See also Art. 19, § 2.)

When the combined length of poop or raised quarter deck and bridgehouse or the length of either of them **exceeds 2/5 of the vessel's length**, in vessels whose numeral is over 125,000, the upperdeck sheerstrake is to be doubled **for the half length amidships** with plating of same thickness as the strake next below, or its thickness increased by one half of the tabular midship thickness, unless compensated for by increasing the bridge side plating and stringer over at least 2/5 of vessel's length, or otherwise.

When the combined length of poop or raised quarter deck, bridgehouse and forecastle or of two of them, or the length of any one of these erections **exceeds half the vessel's length**, in vessels whose numeral exceeds 125,000, the upperdeck sheerstrake is to be doubled **for 3/4 of the length** with plating of same thickness as the strake next below, or its thickness increased by 1/2 of the tabular midship thickness unless compensated for as per preceding paragraph or otherwise.

When a curved gunwale is adopted, the stringer must

## ARTICLE 11

### KEEL.

— 36 —

be laid for its full breadth flat on the beams and the gunwale plate brought up to join it.

The stringer angle bars to be of the size specified in Tables N° 6, for lower decks, but need not exceed  $3\frac{1}{2} \times 3\frac{1}{2} \times 12/32$  steel (7/16 iron).

The size of beams is given in Tables N° 5, but if preferred any other approved form may be substituted. The beams are in all cases to be efficiently riveted to the frames, to the satisfaction of the Surveyor.

In poops, bridgehouses and forecastles every frame is to be carried up to the stringer of these erections, or to the lower part of the curved gunwale.

No reverse frames will be required in poops or bridgehouses if there are no erections on same.

If there are any erections on poop or bridgedeck, the frames below these decks must be stiffened by reverse angles or webplates to the satisfaction of the Administration.

In topgallant forecastles no reverse frames will, as a rule, be required; but in case the forecastle by its form or size might be liable to damage from the sea, its forward end is to be strengthened by reverse frames or stringers and gussets, to the Surveyor's satisfaction.

The deck planking may be reduced one-fourth, but no planks are to be less than  $2\frac{1}{2}$  inches in thickness, or two inches when of teak.

If a poop, a forecastle or a bridgehouse is fitted

to a vessel where the frames do not extend above the upper deck stringer, angle bars of the same size and spacing as frames must be introduced, connected to upper deck stringers by gusset plates and angle bars, and riveted to beam arms and side plating, as ordinary frames.

## ARTICLE 11.

### KEEL.

§ 1. — The form of keel may either be that of a bar, centre plate or flat plate.

#### BAR KEEL.

§ 2. — If a bar keel is adopted, the scantlings must be in accordance with Tables N° 1, and forged in as long lengths as possible. The foremost piece may be bent up in the shape of a fore foot, so as to be scarphed with the foot of the stem. The scarphs to be planed and caulked, and to be in length equal to three times the depth of the tabular keel bar. Rivet holes in the thin ends of scarphs to be drilled after the scarphs are fitted.

#### CENTRE PLATE KEEL.

§ 3. — The depth of centre plate keel must not be less than the united depths of floor plates and bar keel and its thickness as given in Tables N° 3. The centre plate and side plates are to be in as long lengths as possible; their butts must be well shifted with one another and

also with those of the garboard plates. The side plates are to be in depth equal to the ordinary bar keel; the united thickness of the centre and side plates must not be less than the thickness given in Tables N° 1 for ordinary bars keels. (See also Art. 15, § 5 and Art. 17, § 3.) — For riveting, see Art. 27.

## FLAT PLATE KEEL.

§ 4. — If a flat plate keel be adopted, the dimensions to be in accordance with Tables N° 1 for half the vessel's length amidships; beyond this it may be gradually reduced in thickness, but when over 20/32 amidships, it must not be less at the ends than five-sixths of the midship thickness. No reduction from the midship thickness to be allowed at the after end of screw steamers.

The thickness of the adjoining strakes to be as given in the Tables for garboard strakes. The keel butts to be carefully shifted with the butts of the adjoining strakes. (See Art. 24, § 1.)

**In vessels whose numeral is 450000 and above,** the flat plate keel as given in the Tables is to be doubled for its whole length with a plate of the same thickness as the adjoining strakes.

In every case where this form of keel is adopted, an intercostal or a continuous centre plate keelson is to be

fitted and connected to the flat keel plate by two longitudinal keelson angles.

If the keelson is continuous it must have the thickness prescribed for centre plate keels (§ 3).

For further details see Art. 17, §§ 3 and 5, and for riveting see Art. 27.

## ARTICLE 12.

## STEM AND STERNPOST.

Stems, sternposts and propeller frames may be made of forged iron, forged steel or cast steel, provided the material complies with the conditions specified in Art. 33.

## STEM.

§ 1. — The stem must be of the tabular size of the bar keel, but may be gradually reduced, from the light water line upwards, so that the sectional area at the head be 2/3rds of the tabular area. If the fore foot is a part of the stem, the stem may be made in two pieces, the lower one extending towards aft sufficiently to allow the scarp to be placed at a good distance abaft the rounding of the fore foot. The length of scarps is to correspond to those of the bar keel.

## STERNPOST AND STERN FRAME.

§ 2. — **In sailing vessels, paddle and twin screw steamers,** the sternpost is to be at least equal in size to

the bar keel; the dimensions however must be increased if required in order to secure sufficient strength to the rudder gudgeons. The section may be gradually reduced above the counter to the head where it may be two-thirds of the greatest sectional area.

§ 3. — In steamers with a single screw propeller the stern frame may be either a single forging or formed of three pieces with compensation in way of scarphs. In this case the lower part of stern frame and its connection with keel must be in one piece, and the scarphs placed in lower parts respectively of rudder and propeller posts and above the arch of propeller space. In case of scarphed frames a detailed sketch of same must in all cases be submitted through the resident Surveyor for the approval of the Administration.

The keel plate and adjoining strakes are to be connected to the stern frame by three rows of rivets, when these plates have a thickness of  $22/32$  in, and  $20/32$  in, respectively, also in all high speed steamers. It is recommended to use tap rivets for one of the rows.

§ 4. — In screw steamers the size of propeller post to be not less than that given in Tables N° 1, from keel to above the boss. The thickness at boss on each side of the shaft aperture to be at least equal to  $2/3$  of the tabular thickness of the lower part of the post; the upper part of stern frame

may be gradually diminished to the size of rudder post at their junction.

The portion of stern frame forming a continuation of keel may be reduced in moulding but must retain a sectional area equal to that of the propeller post.

§ 5. — The sectional area of the rudder post to be at least equal to 90 % of that of the propeller post, gradually reduced from lower part of rudder trunk to its head, but the sectional area at head (at the level of main deck) must not be less than two-thirds the size at heel.

The head of the sternpost must be firmly secured to the beams and to a plated deck (or to a horizontal plate riveted to the beams when there is no plated deck) by a transom plate having the thickness required for floors amidships and at least once and a half their depth. If transoms of this depth cannot be fitted, compensation will be required.

The rudder braces or gudgeons may be forged on the sternpost or fitted and riveted thereto, but in the latter case the sternpost must be strengthened in way of the rivets. The thickness of the gudgeons round the rudder pintle is to be at least one half the diameter of the pintle and their depth at least  $1\frac{1}{2}$  times that diameter.

The distance between the braces to be from four feet to five feet six inches but never to exceed the latter.

§ 6. — The keel part of stern frames should be gradually rounded up, from propeller post towards aft, as

much as practicable without interference with propeller space, in order to keep the weight of the vessel of the after part of stern frame; when laid on graving dock blocks or on a gridiron.

§ 7. — In all screw steamers whose numeral is 210,000 or above, the propeller post must be carried up to the second deck and firmly secured at its head to the deck beams by angle bars and bracket plates.

§ 8. — The keel portion of stern frame in all vessels whose scantling number is under 140,000 to extend at least six feet towards forward and eight feet in vessels whose scantling number is over 140,000. These are minimum lengths above which it is recommended to go as far as the conditions of manufacture may permit.

The keel portion of stern frame forward of propeller post may be gradually reduced to the size of bar keel at their junction or scarph.

§ 9. — In twin screw steamers the sectional area of the > brackets supporting the outer end of the propeller shaft shall be about 40 % that of the shaft which it supports. A sketch of the brackets showing their connection with the hull is to be submitted to the Administration for approval.

## ARTICLE 13.

### FRAMES.

§ 1. — The frames shall consist of a frame angle and reverse frame riveted together. If preferred, a single bar, such as a Z or channel bar, or a bulb angle, &c., may be used in lieu thereof, provided its strength is not less than that of the tabular built-up frame. (See Table N° 2<sup>5</sup> pink paper.)

§ 2. — The frames to be of the scantlings given in Tables N° 2 and must be spaced as specified in Tables N° 1. The reductions given in the Tables will be allowed over one-quarter of the vessel's length in vessels whose transverse numeral is under 50, and at the after end only when the numeral is 50 or above.

If the frame spacing be increased beyond tabular requirements adequate compensation must be made for same by increasing the scantlings of the framing, beams, shell and deck plating, or otherwise, to the satisfaction of the Administration.

§ 3. — The frames to be in one length from the centre line to the upper deck stringer, and scarphed across the line of keel over three-fourths of the vessel's length amidships, with a piece of angle bar of same scantlings as frame, riveted to the shell plating and to the floors, the length of which shall be such as to receive not less than three rivets

## REVERSE FRAMES

— 40 —

of the tabular pitch and diameter on each side and in each flange. Where a centre plate keel is adopted, this angle bar must be rove through the keel plate. These scarphing pieces will not be required when flat plate keels are fitted.

Rivet holes in way of the turn of bilge are not to be punched until after the frames are bent, likewise the holes in way of plate landings.

§ 4. — In vessels intended for a speed of 14 knots and above all frame angles should be double, at least up to the lower deck abaft the watertight bulkhead at the stuffing box of the stern tube; if preferred, the frames may be connected together and with the shell plating by means of intercostal plates and stringers.

§ 5. — **Deep framing.** — See Art. 16, §§ 16 and 17.

§ 6. — In vessels having their machinery placed aft, the thickness of the frames and reverse frames in the machinery spaces or coal bunkers shall be as given in Table N° 2 for half length amidships.

§ 7. — Where a watertight flat or deck is fitted it is recommended to cut both frames and reverse frames in way of same and connect the frames to the deck by knee plates both above and below. These knees to be of ample size and well riveted to the deck and frames.

## ARTICLE 14.

## REVERSE FRAMES.

§ 1. — Reverse frames of the size specified in Tables N° 2 are to be fitted to each angle frame. The reductions given in the Tables will be allowed over one-quarter of the vessel's length from each end.

The reverse frames must be in one length from the centre line up and to have scarph pieces over the butt at centre line, of the same sectional area, with at least three rivets in each flange on each side of the butt.

§ 2. — The arrangement of the reverse frames is to be regulated by the moulded depth measured to the upper deck in all vessels, except in awningdeck vessels, for which see § 4 hereafter.

§ 3. — The reverse frames on alternate frames are to extend to the upperdeck (for spardeck vessels see Art. 10, § 5), and on the intermediate frames to the upper turn of the bilges in vessels under 12 feet 6 inches in depth; to above the side stringer angle bar in vessels under 14 feet 6 inches in depth, and to above the second deck stringer angle bar in all others. (For vessels with raised decks see Art. 10, § 4.)

When the frames are formed of a single rolled bar

such as a bulb angle, channel or Z bar, etc., the reverse bars on floors to be extended to and efficiently connected with the frames.

§ 4. — **In awningdeck vessels**, all reverse frames to be carried up to the top of second deck stringer angle. (See also Art. 10, § 6.)

§ 5. — **In sailing vessels of 21 feet and more in depth to the upper deck**, the reverse frames must all extend to the upper deck stringer.

§ 6. — For reverse frames in raised decks, full poops bridgehouses, forecastles, see Art. 10, §§ 4 and 7.

§ 7. — **In engine and boiler space and intermediate bunkers**, each floor must be fitted with double reverse frames extending to the lower turn of bilge **in vessels having less than 16 feet depth**, and to the upper turn of the bilge **in all others**, except in vessels with a double bottom, where the double reverse bars inside the double bottom need not be extended beyond the margin plate.

The thickness of reverse frames in way of coal bunkers to be same as for frames.

§ 8. — Reverse angle lugs to be fitted in way of all keelsons and stringer angle bars, for their attachment all fore and aft. (See Art. 17, § 15.) These need not be fitted when intercostal keelsons are used.

When the frames are formed of a bulb angle bar, two angle lugs of the size required for reverse frames

to be fitted in way of all keelsons and stringers, or one lug of sufficient size to admit of four rivets in keelsons, and three in frame. In way of intercostal keelsons one lug only will be required.

§ 9. — Where reverse frames are cut in way of a watertight flat, compensation must be given to the Surveyor's satisfaction. (See Art. 13, § 7.)

§ 10. — **In side-wheel steamers**, reverse frames extending to the upper deck stringer to be fitted to every frame in way of the paddle boxes, or if preferred web or plate frames riveted to beams, paddle beams, frames and floors, may be fitted in lieu thereof. Their dimensions to be approved of by the Administration.

## ARTICLE 15.

### FLOOR PLATES

§ 1. — **In all vessels** floor plates of the dimensions given in Tables N° 2, are to be fitted to each frame.

They may be gradually reduced in depth from the middle line towards their ends, to the moulded breadth of the frames, but at the lower turn of bilges their depth should not be less than one-half of that at the centre line.

The depth of the floors should be increased towards the ends of the vessel, to allow proper attachment for the centre keelson (which must extend as far forward and aft as practicable) and in the after peak of screw steamers they

## ARTICLE 15

### FLOOR PLATES

— 42 —

should be carried as high as practicable to stiffen the after body; in any case to above the stern tube.

The depth of bulkhead floors to be sufficient to admit of the plating being riveted to the floor above the ceiling and fitting the keelson collars clear of the landing.

Transom plates to be fitted of a depth to suit the size and shape of the counter, and over the stern frame.

§ 2. — The maximum thickness of the floor plates is to be retained for half the vessel's length amidships and may be reduced towards the ends of the vessel as specified in Tables N° 2; except at the fore end in vessels of full form, where the midship thickness should not be reduced more than  $\frac{1}{32}$  in for about 15 % of the vessel's length abaft the collision bulkhead, whether with or without a double bottom.

§ 3. — All floor plates in engine and boiler rooms and intermediate bunkers as well as in permanent bunkers adjacent to engine and boiler rooms, to be increased in thickness. (See Tables N° 2.)

§ 4. — The floors must extend up the turn of the bilges to a height equal to at least twice the midships depth, over the greatest possible length. This height may be gradually reduced towards the ends of the vessel, so that the upper edge of floors form a horizontal line.

When floor plates are made of two or more pieces, the butts must be carefully shifted, or, if all butts are placed

on the middle line, they must be fitted with double butt- straps double riveted or overlapped with three complete rows of rivets. (For riveting see Art. 27.)

§ 5. — Floors, in vessels with a centre plate keel or with a flat plate keel and continuous centre plate keelson, must have double angle bars of the same size as reverse frames, fitted vertically on each side of the keel and of the floors, and riveted through the floors and the centre plate.

#### WASH PLATES.

§ 6. — Wash plates connected to the floors by angle lugs are required between the centre line keelson and the bilge keelson in all vessels, with the exception of those which are under 26 feet beam and fitted with intercostal or continuous centre line keelson. These plates to have the thickness required for the lower part of watertight bulkheads and to extend at least over two thirds the vessel's length amidships. (See § 7.)

#### LIMBER HOLES.

§ 7. — Suitable limber holes to be cut in the floor plates above the frames on the centre line in vessels with a centre girder keelson on top of floors; on each side of the centre line where an intercostal or centre through plate keel is adopted, and at the lower turn of bilge in vessels with a full or flat bottom, for not less than half the vessel's length, to admit of a free water course.

All intercostal or wash plates also to have suitable limber holes, to admit of a free water course to the pumps. Limber holes must be cut clean and free from jagged parts.

In addition to the above limber holes, small oval holes may be punched in the vertical flange of the frames to admit of more complete drainage of the bottom.

### ARTICLE 16.

#### BEAMS, WEB FRAMES, AND DEEP FRAMING.

##### BEAMS.

§ 1. — The scantlings of the beams are given in Tables N° 5.

Beams to consist of a bulb with double angle bars on the upper edge, or of a solid T bulb or channel bar, or to be of any other approved form.

When quarter stanchions are fitted and not required by rule, an approved reduction in the size of beams will be allowed.

It is recommended to fit only one angle bar to the beams at the ends of hatchways for the attachment of the deck; the sectional area of this angle bar to be double that of tabular beam angles.

Beams at ends of hatchways over six frame spaces in length and mast-beams at wedging deck in sailing vessels to be increased one inch in depth and  $1/16$ th in thickness and the knees increased in size accordingly. (See Art. 20.)

In three-deck sailing vessels (see Art. 10, § 2) upper deck beams must be of the same size as second deck beams; mast beams to be moreover increased as above indicated.

In vessels of the single deck type with deep framing or web frames as illustrated in Plates B<sub>1</sub> or C<sub>1</sub> the scantlings of beams shall be as required by Table N° 5°.

A reduction of  $1/8$ th in weight from the tabular requirements, will be allowed on the half beams fitted in way of the hatchways.

Deck and hold beams may be gradually reduced at each end, their size being taken according to their actual length, as per Tables N° 5, but the reduction shall not exceed  $1/8$ th of the weight required admids-hips.

The round of beam of upper decks (main deck in awning and shelter deck vessels) should be at least  $1/48$  the length of the beam.

##### BEAM KNEES.

§ 2. — All beams to have welded knee plates of a length not less than two and a-half times the tabular depth of beam for attachment to frames; or, if preferred, plates riveted to the beams, of the same thickness and having the required length, may be adopted, in which case the beam itself must extend to the side plating and be riveted with the frames. The depth of the knee measured dia-

## ARTICLE 16

### BEAMS AND WEB FRAMES.

— 44 —

gonally across the throat to be not less than  $1\frac{3}{4}$  times the tabular depth of the beam.

When a tier of beams is suppressed, the knees of the deck beams immediately above are to be three times the tabular depth of beam.

In the case of vessels of the single deck type whose depth exceeds 22 feet the depth of the beam knees shall be  $3\frac{1}{2}$  times that of the beam and 4 times when the depth moulded exceeds 26 feet.

**In sailing vessels** when the length of the upperdeck beams exceeds 36 feet, the knee plates on each tier of beams shall be in length at least three times the depth of beam. (For the riveting of knee plates, see Art. 27, § 2.)

The rivet holes for the attachment of beams to frames must be drilled in the frame when the beam is in place, with the exception of two, one at each end, which may be punched.

§ 3. — All laid decks, as well as full poops, bridge-houses, forecastles and raised decks, to have beams on every alternate frame, and half beams in way of all hatchways and other openings in the deck.

When a steel or iron deck is fitted, and not covered with wood, beams must be, as a rule, fitted on every frame (exceptional cases to be submitted for approval). The scantlings of these beams are to be as given in Table N° 5. In such cases an approved longitudinal

web formed of plate bulb or double angle bar, having a sectional area at least equal to that of the tabular beam, must be carried along the lines of pillars, for their attachment. Bulb beams of tabular dimensions will be required at the end of hatchways.

§ 4. — The arrangement of beams is to be regulated by the moulded depth measured **to the upper deck at midlength**, except in awning deck vessels in which the depth is to be measured to the second deck. (For raised decks, see Art. 10, § 4.)

At the fore and after ends of the vessel, the requirements for stringers, beams, pillars &c. shall be considered with reference to the actual depth of the hold.

**In vessels fitted with a double bottom** the moulded depth in way thereof, for the requirements of Plates A, B and C, may be reduced by an amount equal to the difference between the tabular depth of floors and that of double bottom, but this reduction may not exceed 12 ins.

§ 5. — The number of tiers of deck beams (two frame spaces apart) and of strong hold beams (ten frame spaces apart) shall be as follows and as shown on the accompanying Plate A.

Depth as per preceding paragraph.

Under 15 feet.	1 tier beams.
15 ft. and under 22 ft.	{ 1 tier beams. 1 tier strong hold beams.

22 ft. and under 24 ft.	2 tiers beams.
24 » » » 31 »	{ 2 tiers beams. 1 tier strong hold beams.
31 » » » 35 »	3 tiers beams.
35 » » » 39 »	{ 3 tiers beams. 1 tier strong hold beams.
39 feet and above. . .	{ 4 tiers beams and special consideration.

*N. B.* — If a deck is to be introduced at the level of the strong hold beam it must be laid on beams of tabular upper deck scantlings spaced not more than two frame spaces apart (see also § 3).

§ 6. — **SAILING VESSELS.** — In sailing vessels up to 19 feet moulded depth to the second deck, the third tier of beams may be dispensed with, provided a stringer plate be introduced, fitted as per Art. 18, § 5. If preferred, two side stringers, formed of a bulb plate riveted between two angle bars, or of a plate between two bulb angles of an equivalent sectional area, may be substituted for such a stringer plate. In the former case, the angle bars to have the size of the keelson angles, to extend the full length of the vessel and to be connected at both ends by gusset plates. The plate or bulb plate to have the thickness required for second deck beams. For three-fourths of the vessel's length the plate or bulb plate must be connected to the side plating by angle bars of

the same size as reverse frame angles; beyond that length it may be reduced in width and the connection with side plating dispensed with.

Vessels which claim the benefit of either of these arrangements shall in no case be entitled to the reductions granted by Art. 10, § 2 to three-decked vessels.

§ 7. — Strong hold beams to consist of a bulb with two angle bars on the top edge, covered with a plate of the same thickness as the bulb, as specified in Tables No 5.

These beams are to be fitted to every tenth frame, and connected to the stringer plates by horizontal gusset plates of the same thickness as the stringer plate. The gussets are to be two frame spaces in length and one in breadth.

§ 8. — The height of tween decks for which the requirements of Plates A., B. and C. have been framed is seven feet six inches.

The Administration may require additional strengthening below the lowest tier of beams, beyond what is shown on Plates A., B. and C. when the height of tween decks is less than 7 ft. 6 ins.

When the moulded height between the beams exceeds eight feet, compensation will be required in the 'tween decks.

§ 9. — As many through beams as can be fitted are to be introduced in way of the engine and boiler spaces,

## ARTICLE 16

### WEB FRAMES.

— 46 —

in addition to web frames specified in § 18. The scantlings of same to be as per Table N° 5<sup>4</sup>.

§ 10. — Panting beams with suitable stringer plates and horizontal gusset plate are to be fitted in the forward end of sailing vessels and paddle steamers, and in both forward and after ends of screw steamers. These plates are to be riveted to the shell by means of angle bars. The panting stringers should not be more than 4 ft. 6 ins apart. Panting arrangements, which should extend well abaft the collision bulkhead, are to be submitted for approval.

In steamers of full form, or whose speed exceeds 12 knots, the panting arrangements are to be carried abapt the collision bulkhead as far as the fore hatch. If preferred, web frames may be substituted for the strong hold beams.

§ 11. — Beams of the scantlings required by Tables N° 5 for beams on every frame to be fitted on every frame under windlasses and winches.

§ 12. — If the number of beams cut for hatchways, including machinery and all other openings, exceed 40 % of the total number of beams required by rule, compensation is to be provided by increasing the scantlings of the remaining beams.

### WEB FRAMES IN LIEU OF LOWER DECK OR HOLD BEAMS.

§ 13. — Hold beams, and in some cases lower deck beams, may be replaced by web frames having double angles of reverse bar scantlings rivetted to their inner edge.

The arrangement, spacing and width of web frames is shown on Plates B. Their thickness is to be the same as that of the tabular frame angles.

The web frames shall extend from the deck above the tier of beams dispensed with to the floors, and shall only terminate where the depth of the latter is at least equal to the width of the web. They must be at least double riveted thereto, and connected at their head with the deck beams by large bracket knees having at least three times the depth of the beams. Whenever the deck is not steel or iron plated, the beams to which the head of web frames is attached to be of the dimensions required for strong hold beams. If web frames cannot be fitted to correspond with the beams, vertical brackets must be fitted above and below the deck stringer for its connection to the web frames.

§ 14. — The number and arrangement of side stringers in conjunction with web frames is shown on Plates B. They are to be of the same breadth and thickness as the web frames and to have double angle

bars of tabular frame size riveted to their inner edge (or equivalent) all as shown on Plates B.

When the ordinary frames are deeper than required by Tables N° 2 the thickness of the side stringers must be increased to compensate for their area being reduced in way of frames.

In this method of construction the side stringers may be intercostal between the web frames, or the web frames intercostal between the stringers. In either case the stringers and web frames, at their intersection, must be strongly connected together by double angle lugs of reverse frame size, and by face or diamond plates in a thoroughly efficient manner to the satisfaction of the Surveyor.

The side stringers shall be connected to the shell between the frames by a single angle bar of the size required for the lower deck stringer angles and a single longitudinal bar of the same size is to be fitted to connect the stringer to the reverse frames and lugs.

A sketch of web frame, stringer and connections (with riveting) should be submitted for the approval of the Administration.

#### WEB FRAMES IN SAILING VESSELS

§ 15.— In sailing vessels of or over 23 ft. in depth to upperdeck, two web frames shall be fitted on either sides in way of each mast, extending to the deck stringer con-

nected to the sheerstrake to which the chainplates of lower rigging are riveted. Instead of these web frames a bulkhead may be fitted at about the middle of the vessels length, or the scantlings of frames in way of each mast may be increased or any other equivalent compensation may be submitted for the approval of the Administration.

#### DEEP FRAMING IN LIEU OF LOWER DECK OR HOLD BEAMS.

§ 16. — Web frames in lieu of hold beams may be dispensed with if the transverse flanges of the frame and reverse frame be increased so that the depth of the framing shall be as specified in Plates C. The deep framing is to extend at least to the deck above the tier of beams suppressed.

The width of the fore and aft flange of the angle bars composing the frame must be in accordance with what is given in Table N° 2 for frames, and thickness about 10 % more than required by that Table. The overlap of the frame and reverse bar must be  $4\frac{1}{2}$  times the diameter of the connecting rivets.

In lieu of separate frame and reverse frame, single bars of channel or zed section may be used, having the same depth, width of flanges and thickness as required for the compound arrangement.

The above refers to deep framing with frame and reverse frame, or single bars of channel or zed section.

## ARTICLES 16 AND 17

### FRAME STRENGTHENING. — KEELSONS.

— 48 —

When bulb angle bars are used for deep framing their depth shall be 15 % to 20 % greater than given by Plates C, and thickness 15 % to 20 % more than specified by Table N° 2 for ordinary frames. The width of the shell flange to be the same as for ordinary frames.

§ 17. — The number and arrangement of the side stringers in conjunction with deep framing to be as shown on Plates C. In general, these stringers are to be formed of intercostal plates having, in all cases, a thickness equal to that of frames and connected to the reverse frames by double angles of tabular frame scantlings; or a single bar may be fitted having a sectional area equal to that of the double frame angles and having a flange broad enough to take two rivets through the reverse frames. Where by Plates C, three or four angle bars are required on the side stringers, their scantlings shall be as per Tables N° 2 for frame angles and the width of stringer plate increased sufficiently to take the two broad flanges of these bars.

In all cases the shell intercostal bar is to be of the size given in Table N° 6 for lower deck stringer bars.

Any form of side stringer of equivalent strength may however be used with the sanction of the Administration.

### FRAME STRENGTHENING IN ENGINE AND BOILER SPACE.

§ 18. — In all steamers of or over 15 ft. in depth web frames shall be fitted in the engine and boiler

room and cross bunkers within the range of same. They shall be spaced two frame spaces closer than what is specified in Plates B for web frames in lieu of strong hold beams, and shall extend at least to the height of the deck which forms the crown of the compartment in which they are fitted. Where they are discontinuous at deck stringer plates their strength is to be carefully maintained by bracket or diamond plates and double angle connections.

The scantlings of these web frames and arrangement of side stringers are to be in accordance with what is specified in the preceding paragraph.

In lieu of web frames in machinery spaces when deep framing is employed, the framing shall be 1/2 ins. deeper and 2/32nds thicker than the ordinary requirements of § 16 of this article.

As many strong beams as practicable to be introduced at each deck. The scantlings of same to be as per Table N° 5<sup>1</sup>.

## ARTICLE 17.

### KEELSONS AND HOLD STRINGERS.

§ 1. — Middle line keelsons may be of either of the following types : centre plate keel (see Art. 11, § 3) ; continuous vertical plate in connection with a flat plate keel (Art. 11, § 4) ; girder above floors (centre plate with angle bars along its upper and lower edges) ; intercostal

plates, fitted between and projecting above the floors, with angle bars running fore and aft on each side. They may be of any other approved form.

§ 2. — All middle line keelsons, unless fitted intercostally, to be carried continuously through the bulkheads (except where impracticable and in the case of peak bulkheads) as far forward and aft as practicable, and to be well secured to the double reverse angles and floors.

A gradual reduction of one-third in weight will be allowed at the extreme ends, beyond the stepping of the fore and mizen masts. The maximum size however to be retained over two-thirds of the vessel's length amidships.

CENTRE PLATE KEEL AND CONTINUOUS CENTRE PLATE KEELSON IN CONNECTION WITH A FLAT PLATE KEEL.

§ 3. — For scantlings and requirements for centre plate keels see Article 11, § 3 and Tables N° 3.

When a continuous centre plate keelson is used with a flat plate keel, it must have the same thickness as a centre plate keel, and be connected to the flat plate keel by two keelson angle bars.

The following requirements apply to both the centre plate keel and keelson.

**When the centre plate projects above the floors,** the reverse frames, which are cut along the centre plate, must be scarphed by an angle lug of the same size, rove through

the centre plate; the length of this lug at each side from centre line to be not less than the breadth of the horizontal plates hereafter described. Horizontal plates must be fitted on the floors, one on each side of the centre plate; their thickness must be equal to that of the floor plate, and the breadth of each not less than  $\frac{3}{4}$ ths the depth of the floors. They must be connected to the centre plate by two fore and aft keelson angle bars, and riveted to the reverse frames for the whole length of the centre plate.

**When the centre plate does not project above the floors,** a horizontal plate must be fitted on the floors as far forward and aft as practicable, of the same thickness as the centre plate and having a breadth equal at least to  $1\frac{1}{2}$  times the depth of the floors. The scarphing piece of the reverse frames, as required in the preceeding case, to be replaced by two angle lugs whose length shall not be less than half the breadth of the horizontal plate, to connect efficiently the said plate to the floors. The horizontal plate must be connected to the centre plate by two fore and aft keelson angle bars.

As many rivets as practicable to be used in attaching the keelson to the floors. — For riveting, see Art. 27.

GIRDER KEELSON ON TOP OF FLOORS.

§ 4. — The vertical plate of girder keelsons must be fitted with four longitudinal keelson angle bars.

A rider plate must be fitted on the top angle bars and riveted thereto for  $\frac{3}{4}$ ths of the length amidships. The dimensions of this plate and the size of the angle bars are given in Tables N° 3.

A foundation plate of the dimensions given in Tables N° 3, to be fitted over the greatest possible length whenever this keelson is above 18 inches in height. Should a foundation plate be fitted when the keelson is less than 18 inches, a proportionate reduction will be allowed on the other parts of the keelson.

A doubling reverse angle lug must be fitted to the top of floors, and the longitudinal keelson angles riveted to it. (See § 15 hereafter.)

Where masts are stepped on girder keelsons, the keelson must be carefully strengthened to the satisfaction of the Surveyor.

#### INTERCOSTAL CENTRE KEELSON.

§ 5. — The thickness of intercostal centre keelsons is given in Tables N° 3.

The intercostal plates to be connected to the flat plate keel by two keelson angle bars, and at each end to the floors by two vertical angle bars of the size specified for reverse frames.

When intercostal centre keelsons extend from the keel to above the floors, they are to be fitted between two ho-

izontal plates to which they must be connected by double longitudinal keelson angle bars of the dimensions given in Tables N° 3. Each of the horizontal plates to be of the same thickness as the intercostals and in width to be equal to  $\frac{3}{4}$ ths the depth of floors.

If the intercostal plates do not extend above the floors, a plate of the same thickness as floors and in breadth equal to one and a-half times the depth of floors, must be fitted horizontally over the intercostal plates to which it must be secured by two longitudinal angle bars same size as keelson angle bars.

When this keelson is adopted in vessels over  $11\frac{1}{2}$  depths in length to the upper deck in single deck vessels, and to the second deck in all others, additional strength will be required in the form of a vertical plate with two keelson angles at the top, riveted between the two longitudinal angle bars. If the vessel is less than 15 depths in length to the second deck the thickness of this vertical plate to be the same as that of the intercostal centre keelson plate and its depth to be half that required by the Rules for the centre plate of girder keelsons, but in no case to be less than twice the width of the wider flange of keelson angles. If the vessel is 15 and not over 16 depths in length to the second deck, the depth of this vertical plate must be  $\frac{2}{3}$ ds of that required by the Rules for the centre plate of girder keelsons. If

the vessel is over 16 depths in length to the second deck, the depth of this vertical plate must be  $\frac{3}{4}$ ths of that required by the Rules for the centre plate of girder keelsons, but in no case to be less than twice the width of the wider flange of keelson angles.

#### INTERCOSTAL SISTER OR SIDE KEELSONS.

6. — Intercostal keelsons to be fitted midway between middle line and lower bilge keelson (see § 7) **in vessels exceeding 32 feet in breadth or 275 feet in length; in all three-deck and spardeck vessels** and in some vessels of extreme proportions (Art. 32). — The intercostal plates to run over  $\frac{2}{3}$ rds the vessel's length amidships and to project above the floors between double keelson angle bars, extending as far forward and aft as practicable. The thickness of the intercostal plates is given in Tables N° 3; the intercostal plates to be in all cases riveted to the skin, and whenever the tabular depth of floors is 22 inches at the centre line, also to the floors at each end as far fore and aft as practicable, by a single angle bar of the size required for reverse frames.

For vessels in which the above requirements are not to be applied, see Art. 15, § 6.

#### BILGE KEELSONS AND BILGE STRINGERS.

§ 7. — **All vessels** — except in way of continuous or

partial double bottoms, if any (see Art. 25) — to have a keelson formed of double angle bars fitted back to back at the lower turn of the bilges, extending from stem to stern, well secured to reverse frames and lugs; and to be united at the ends by gusset plates or breasthooks connected to the shell plating, to the satisfaction of the Surveyor. These angle bars to be in accordance with Tables N° 3.

§ 8. — **Vessels of 14 feet depth and upwards**, measured according to Art. 16, § 4, to have double angle bars fitted back to back at the lower, and also at the upper turn of the bilge, extending as far forward and aft as practicable, well secured to reverse frames and lugs, and to be united at the ends by gusset plates or breasthooks, to the satisfaction of the Surveyor.

These angle bars to be as specified in Tables N° 3.

§ 9. — In all vessels of 25 ft. in depth and above a bulb plate of the size required for second deck beams must be fitted between the lower bilge keelson angles for two-thirds the vessel's length amidships.

The requirements for the bilge stringer are indicated in Plate A.

In all vessels of 14 ft. 6 in. depth and above a bulb plate of the size required for second deck beams must be fitted to the bilge stringer extending aft from the stem for one eighth of the vessel's length.

It is however to be extended aft so as to scarph with the bulb fitted amidships if such be required.

#### HOLD STRINGERS.

§ 10. — A hold stringer is to be fitted between the bilge stringer and the lowest tier of beams, in those cases indicated by Plate A, which also shows what is required for same. The angle bars are to be of keelson angle scantlings as per Table N° 3; bulbs to be of the size required for second deck beams; and stringer plates of the scantlings given in Table N° 6 for hold beam stringers.

#### KEELSON ANGLE BARS.

§ 11. — All keelson and stringer angle bars to retain the dimensions specified in the Tables, for 2/3rds of the vessel's length amidships; a reduction of 1/16th in thickness will be allowed beyond this length in angles of and over 12/32 for steel (7/16 iron).

#### GENERAL ARRANGEMENTS.

§ 12. — All keelson and hold stringer plates, angle bars or bulbs, where interrupted in their continuity by bulkheads, to be fitted with gusset plates of the same thickness as keelson angles, and riveted together through the bulkheads, to the satisfaction of the Surveyor; or they may be carried continuously through the bulkheads,

provided watertight collars be fitted at the bulkheads in way of them to the satisfaction of the Surveyor.

The distance between the bilge keelsons and the hold stringers, and from hold stringer to hold stringer, is nowhere to exceed 6 feet, measured on the girth of frame.

§ 13. — All butts of keelson, bilge and hold stringer angle bars or bulbs to be connected with scarphing pieces to the Surveyor's satisfaction, of not less than two feet in length, and to have in each flange at least three rivets on each side of the butt. Bulbs used in keelsons may be lapped, the length of the overlap being at least equal to 2 1/2 times the depth of the bulb.

§ 14. — Double reverse angle lugs to be fitted on each frame or floor all fore and aft in way of all keelsons, hold, side and intermediate deck stringers, to which the keelsons and stringer angles are to be riveted as well as to the reverse frames. The length of these lugs to be sufficient to receive at least three rivets in the frames or floors. The lugs may be dispensed with where intercostal keelsons are fitted and connected with the shell plating and floor plates.

§ 15. — The longitudinal angle bars to be secured to the frames by the smaller flange except in middle line keelsons where the larger flange should be riveted to the reverse frames and lugs and to the horizontal plates of keelsons.

## ARTICLE 18.

## STRINGER PLATES.

§ 1. — Stringer plates to be fitted and riveted on each tier of beams and on hold beams **in all vessels**. When web frames are fitted instead of beams, and the tabular width of stringers is objected to, compensation will be required. (See Art. 16, § 13.)

The scantlings of stringer plates and angle bars are given in Tables N° 6. **The tabular width of the stringer plates to be measured from the inner edge of the framing, except where the plates are not cut by the frames.** The width and thickness are to be retained over half the vessel's length amidships and may thence be gradually reduced towards the ends as indicated in the Tables.

**When steel or iron decks of tabular thickness are fitted** whether required by the Rules or not, the width of the stringer plates may be one-third less than that prescribed for stringer plates with wood decks. This reduction may extend over half the vessel's length amidships, the plates being gradually tapered to the tabular width at the ends. When the plating extends over only a part of the deck, the above reduction will not be allowed beyond this part. (See Art. 22, § 1.)

If it is desired to plate the second deck instead of the upper deck in two or three decked vessels not belonging

to the awningdeck type, the depth for determining the breadth of the stringer plates must be taken to the 2nd instead of the upper deck.

§ 2. — Upper deck stringer plates to be connected to the side plating by longitudinal angle bars of the size required for stringer angles, extending all fore and aft. Compensation will be required where the angle bar is interrupted by scuppers.

Where the upper deck stringer angle is  $4 \times 4$  and above, both flanges to be double zigzag riveted, and in vessels 400 feet long and above, another angle of same dimensions to be fitted intercostally under the stringer plate, riveted to it and to the outside plating.

§ 3. — The stringer plates on all lower decks and hold beams and also hold stringer plates (§ 5 hereafter), to be connected to the outside plating by angle bars, as well as to the reverse frames and lugs by a continuous angle bar fitted all fore and aft on inner edge of frames; all these angle bars to be according to Tables N° 6.

§ 4. — In all cases where the distance between the beams exceeds two spaces of frames, a bracket knee plate of the same thickness as the beam knees to be fitted and riveted to alternate frames and to the stringer plate.

§ 5. — Hold stringer plates supported by brackets as described in the preceding paragraph will be required as indicated by Plate A. Their width and thickness are

## ARTICLE 19

### LONGITUDINAL TIE PLATES.

— 54 —

to be in accordance with Table N° 6 and they are to be strengthened on their inner edge by single or double angle bars of keelson size arranged as in Plates B, in some cases with additional face plate one half inch thick.

#### GENERAL ARRANGEMENTS

§ 6. — Stringer plates to be carried through watertight bulkheads without interruption, and to be connected at the forward and after ends by gussets of the same thickness as the plates connected.

All stringer angle bars to retain their midship thickness for  $\frac{2}{3}$  the length amidships; a reduction of  $\frac{1}{16}$ th in thickness will be allowed beyond that length in angles of and over  $\frac{12}{32}$  for steel ( $\frac{7}{16}$  for iron).

Buttstraps are to be fitted at the butts of all continuous stringer bars.

When holes are cut in stringer plates, as for instance for discharge pipes of pumps, coal shoots, etc., compensation is to be given.

For stringers, angles and ties of full poops, bridgehouses, forecastles, awning and spardecks, see Art. 10, §§ 5, 6 and 8, and also Tables N° 6.

## ARTICLE 19

### LONGITUDINAL TIE PLATES.

§ 1. — All vessels to have longitudinal tie plates from forward to aft on each side of the hatchways on each tier

of beams—strong hold beams excepted—where no plated deck is fitted, riveted to all beams, and at the ends to the stringers. The same applies to poops, forecastles and bridgehouses. The dimensions of the tie plates are given in Tables N° 6. These dimensions to be retained over half the vessel's length amidships, after which the thickness may be gradually reduced at the extreme ends as indicated in the Tables.

In lieu of tie plates on beams where no deck is laid, angle bars having an equal section, or other approved compensation may be substituted.

When the deck openings are over 6 and under 9 frame spaces in length, the tie plates must be proportionally increased in width up to twice the tabular width, for the full length of the hatchway (see also Art. 20, § 4), and then gradually reduced to the tabular size beyond the ends of the opening.

For openings whose length exceeds 9 frame spaces, see Art. 20, § 4.

### DIAGONAL TIE PLATES.

§ 2. — Where there is no plated deck, diagonal ties must be fitted on all upper and second decks, of the same size as the longitudinal tie plates, and riveted to the latter, to the mast partner plates and to the side stringers, also on poops, forecastles and bridgehouses exceeding  $\frac{1}{4}$  of the vessel's

length. At the mizen mast on the upper deck of steamers, when no poop is fitted, diagonals are not required.

#### MAST PARTNERS, PLATES UNDER WINDLASSES AND WINCHES.

§ 3. — Mast partners plating on non-plated decks to be in length equal to four frame spaces, in breadth at least twice the diameter of the hole cut for the mast (three times at wedging decks of sailing vessels), and in thickness same as deck ties. They are to be well riveted to the beams and efficiently connected and riveted to the deck ties.

Mast holes at wedging decks, if said decks are plated, to be strengthened by doubling plates of the same thickness as the deck plating, and of suitable dimensions.

Coamings formed of an angle bar of the same size as for keelsons, to be fitted round the masts for wedging.

Plates of a suitable size to be fitted under the windlass, cranes and winches and to be not less in thickness than the mast partner plates. (See also Art. 16, § 11 & Art. 29.)

### ARTICLE 20.

#### DECK OPENINGS AND HATCHWAY COAMINGS.

§ 1. — Hatchway coamings of exposed decks to be of steel or iron, of at least the thickness given in Table N° 8. Their height above deck planking shall be in no case less than 24 inches (18 inches in vessels under 100 tons gross). Hatch coamings of or over 24 inches in height

above the deck, or above 16 ft. in length are to be stiffened or increased in thickness to the Surveyor's satisfaction.

The height of hatch coamings on decks below the weather deck need not exceed 12 ins. Their thickness to be as specified in Table N° 8.

In vessels with a comparatively low freeboard, it is recommended to make the upper deck hatchway coamings at least 30 inches deep. In vessels of the « welldeck » type they should be carried up higher to the Surveyor's satisfaction.

All hatch coamings must extend to the bottom of the beams, and be connected thereto by double lugs (rivets not to exceed 4 diars. apart) when beams are fitted on alternate frames. The scantlings of the angle bar connecting to the deck shall be as given in Table N° 8.

§ 2. — Forward companions of steamers when not protected by the forecastle, also those of the engine and boiler rooms, to be of steel or iron.

§ 3. — Hatchways and deck openings on upper and other decks **when exceeding 12 feet in length**, to be provided with strong iron or steel shifting beams of suitable size, spaced not to exceed eight feet, and to be secured to the satisfaction of the Surveyor.

Cargo hatchways to have one fore and after, and when exceeding 10 feet in width, to be fitted with two fore and

afters for the support of the hatches, to the satisfaction of the Surveyor.

Fore and afters will not be required when shifting beams are spaced so as not to exceed two frame spaces apart.

§ 4. — **When the length of hatchways is over 6 frame spaces**, in addition to the foregoing, the beams at ends of same to be increased one inch in depth and 1/16th in thickness.

The tie plates to have twice the tabular width for the full length of the hatchway, and thence to be gradually reduced to the tabular size beyond the ends of the opening.

**When the length of hatchways is over 6 and under 9 frame spaces**, in addition to the foregoing requirements one pillar at least to be fitted on each side under the fore and aft coamings, continued from upper deck to floors and a web frame is recommended in hold in way thereof. For the construction of web frames, see Art. 16, § 13.

§ 5. — **When the length of hatchways is over 9 frame spaces**, in addition to the requirements as per §§ 3 and 4, in all cases where a plated deck is required by Rules the strake next to the hatchway on each side to be increased 1/16th of an inch for the full length of the opening; otherwise, the tie plates to be increased as above and the space between the tie and stringer plates to be

plated. The full width of this plating to be continued for the whole length of the opening and carefully tapered into the stringer plates, for at least six frame spaces beyond each end of the hatchway. The plating to be of the thickness required for plated decks as per Tables N° 6.

**If the hatchway is over one-third of the beam in width** an additional increase in thickness shall be required.

In such cases, in addition to the requirements as per §§ 3, 4 and 5, at least two pillars shall be fitted under the fore and aft coamings on each side, continued from upper deck to floors, and two web frames are recommended in hold in way thereof. For the construction of web frames, see Art. 16, § 13.

If the total length of all the hatchway openings, including machinery and all other openings, exceed 40 % of the vessel's length, the deck beams and plating between the hatches must be increased beyond tabular requirements to the satisfaction of the Administration.

§ 6. — The deck plating in way of the corners of all deck openings **exceeding 6 frame spaces in length** to be strengthened with doubling plates of a suitable thickness or otherwise, as may be approved, and corner pillars to be fitted if required by the Surveyors.

§ 7. — **ENGINE AND BOILER ROOM HATCHWAYS.** — The coamings of the engine room skylight and of boiler casings to be not less than 30 inches in height above deck; however,

on upper decks of awningdeck vessels, also on poops and bridgehouses, this height may be reduced to 18 inches.

Engine and boiler hatchways must be enclosed from the second to upper deck by steel or iron casings. When a doorway is cut in these casings, the bottom of the doorway should be not less than 18 inches above the deck.

From the crown of the machinery space upwards, the coamings and side plating of engine and boiler casings are to be of the thickness given in Table N° 8 for deckhouse coamings and sideplating.

These casings shall be stiffened by angle bars as given in that Table or in an equivalent manner to the satisfaction of the surveyor.

Plate covers must be provided for closing all openings or gratings in heavy weather.

In way of the engine and boiler room hatchways in all vessels, the upper and second decks must be strengthened according to the Rules of the preceeding paragraph for hatchways over 9 frame spaces in length.

## ARTICLE 21

### PILLARS.

§ 1. — **Each tier of beams** where practicable to be supported by iron pillars from the keelson upwards, placed not more than two frame spaces apart, except for one-eighth the vessel's length forward in screw steamers,

and at each end in sailing vessels, where they may be fitted at double that distance. But in steamers whose number exceeds 360,000, pillars are to be fitted at the midship distance all fore and aft, also in sailing vessels whose number exceeds 180,000.

In large vessels of the single deck type illustrated in Plates B<sub>1</sub> & C<sub>1</sub>, it is recommended to adopt two rows of pillars of double channel, or other suitable section, fitted in way of each strong beam, and at the head of same to fit a strong fore and aft girder, either above or below the deck, or if necessary both above and below the deck, in order to give adequate support to the intermediate beams. The scantlings of such an arrangement to be specially considered.

Quarter stanchions not more than two frame spaces apart must be fitted in vessels of 44 feet to 56 feet in breadth. — But when in such vessels centre pillars are introduced, these must be fitted not more than two frame spaces apart and the quarter pillars not more than four frame spaces apart.

In all vessels of or over 56 feet in breadth, centre line pillars and quarter pillars not more than two frame spaces apart, shall be fitted to each tier of beams wherever the length of beam exceeds 44ft.

But the pillaring of passenger vessels and vessels with extensive deck erections shall be specially considered.

## ARTICLE 21

### WIDE SPACED PILLARS.

— 58 —

Pillars to be fitted at every alternate frame in poops, bridges and forecastles; in steamers whose number exceeds 350,000, it is recommended to fit two pillars at every alternate frame in forecastle.

Additional pillars to be fitted under winches, cranes, windlasses and steering gear, to the satisfaction of the Surveyor.

Pillars to be fitted at corners of hatchways, according to the width of openings and also at corners of large deck-houses as may be required by the Surveyor.

Fore and aft coamings of hatchways whose length exceeds six frame spaces to be supported by at least one pillar, and when the length exceeds nine frame spaces, by at least two pillars on each side.

The diameter of solid round iron pillars for upper deck and lower hold beams, is given Table N° 9.

In vessels having three tiers of beams an intermediate size may be adopted for the support of the middle deck beams.

Hollow pillars, double pillars for shifting boards or pillars of any other form may be fitted, when desired, provided they be of equivalent strength.

Hollow pillars shall have an external diameter of 1.4 times and internal diameter 1.15 times that of the corresponding solid pillars given in Table N° 9.

For diameters exceeding 5 1/2 ins. it is recommen-

ded to adopt pillars made with channel bars or bulb angles riveted together and having strength at least equal to the tabular round section. They are to be well bracketed at head and heel. Details of the arrangements must be submitted for the approval of the Administration.

All round pillars to have solid forged heads and heels and to be efficiently secured at both ends.

Where the pillars are not connected to the main or side keelsons or waterballast bearers, their heels must be secured to the satisfaction of the Surveyor.

When the pillars rest on the tunnel, the latter must be strengthened to the satisfaction of the Surveyor.

For the arrangement of longitudinal girders under beams in way of pillars, see Art. 16, § 3.

In all cases the arrangement and scantlings of the pillars are to be submitted for the approval of the Administration.

### WIDE SPACED PILLARS.

§ 2. — Instead of the requirements above described for solid pillars as per Table N° 9 pillars of larger dimensions spaced at intervals not exceeding 12 frame spaces may be employed in association with strong fore and aft girders at the head of same.

If wide spaced pillars of tubular section be adopted

TABLE D<sup>1</sup>

ARTICLE 21

WIDE SPACED PILLARS ATTACHEMENT AT HEADS AND HEELS

TABLE D<sup>2</sup>

ARTICLE 21

WIDE SPACED PILLARS ATTACHEMENT AT HEADS AND HEELS

their external diameter (D) and thickness (T) in inches shall be as given by

$$D = (.17 \ n + 1.06) \ d$$

$$T = .03 \ D + .15$$

$d$  being the diameter of the solid pillar which would be required by Table N° 9 and  $n$  the number of frame spaces in the span.

The thickness T shall be not less than  $11/32$  in.

The diameter and thickness of tween deck pillars will be obtained from Table N° 9 by means of the same formulæ.

The scantlings of both hold and tween deck pillars are to be increased if the height of tween decks exceed 8 feet.

The span will be reckoned at half the distance from the bulkhead or pillar immediately before, to the bulkhead or pillar immediately abaft, the pillar under consideration.

The head and heel of such pillars shall be fitted, as may be required, with transverse and fore and aft bracket plates well riveted to the beam girders, decks, or double bottom.

Floor plates, whether in double bottom or not, shall be carefully stiffened in way of wide spaced pillars, as may be required by the Administration.

At each line of pillars, and at the head of same, a

strong continuous girder shall be fitted underneath the deck beams. Where cut at bulkheads the girders must be well connected thereto by large bracket plates.

The standard construction of the fore and aft girders will be as follows, and as indicated on Plate D, which shows also methods of connection at head and heel.

The fore and aft girders shall consist of double channels of the scantlings given in Tables N°s 5<sup>1</sup> and 5<sup>2</sup> for the second deck beams (3rd. column, beams on alternate frames) having a length equal to the breadth of the deck at the middle of the span between consecutive pillars, or equal to twice the span, whichever is greater. If the span however be less than 10 frame spaces the depth of channels may be less than given by the above rule, to the extent of  $1/2$  for each frame space less than 10.

The channels shall be fitted back to back, and shall have between them, and riveted to them, an intercostal plate  $2/32$  in. thicker than the deck plating to which it shall be connected by an angle bar of approved scantlings. The butts of the channels shall be carefully shifted and efficiently strapped.

Vertical web plates are to be fitted to the transverse bulkheads in line with each of the fore and aft girders, to which they shall be attached by means of the bracket plates above mentioned.

## DECKS.

In vessels having a double bottom a side intercostal should be arranged, so as to be in line with each row of pillars; and in vessels without a double bottom a keelson should be similarly arranged and strengthened beyond rule requirements to the satisfaction of the Administration.

In any case the thrust of the pillar must be communicated to at least three floors by the introduction of intercostals between the floors, or equivalent.

Any other system for the construction of pillars and fore and aft girders will be accepted provided it is at least equal in strength and efficiency to that above described for tubular pillars and double channel girders.

Plate D<sup>1</sup> shows various arrangements which may be adopted.

In any case complete details of an arrangement of wide spaced pillars must be submitted to the Administration for their approval.

## ARTICLE 22.

## DECKS.

## PLATED DECKS.

§ 1. — Plated decks must be fitted in accordance with Tables N° 6.

When a plated deck is substituted for a wood deck, the thickness of same is also to be found in these Tables.

If it is desired in two- or three-deck vessels (not being awningdeck vessels) to plate the second deck instead of upper deck, the depth for determining the breadth of the stringer plates must be taken to the second instead of the upper deck.

Where a plated deck required by rule is suppressed in vessels having deep frames or web frames in lieu of a tier of beams adequate compensation must be made for same.

Compensation will likewise be required when a deck is partially suppressed or cut into on account of large engine and boiler or other openings.

In vessels of the single deck type in which a second deck required by rule is dispensed with, the thickness of the upper deck plating between stringer plates and hatch coamings is to be increased by 50 % and between hatches by 25 %. (See Art. 10, § 3.)

For reduction on stringer plates of plated decks, see Art. 18, § 1 and Tables N° 6.

Whenever the deck plating is not covered with a wood deck, the spacing of the beams must not, as a rule, exceed that of the frames. Exceptional cases to be submitted for approval. (See Tables N° 5 and Art. 16, § 3.)

The tabular thickness of plated decks to be maintained for half the vessel's length amidships; it may be gradu-

ally reduced towards the ends, to not less than  $8/32$  steel ( $5/16$  iron), even if covered with a wood deck.

The deck plating between the hatchways may be reduced  $1/16$ th in thickness, but in no case to be less than  $8/32$  steel ( $5/16$  iron), even if covered with a wood deck.

For plating under winches, etc. (See Art. 19, § 3.)

All steel and iron decks, either partial or complete, must be caulked, except when covered with wood sheathing caulked watertight. Upper deck stringer plates, stringer and waterway angle bars, angles round coaming plates, etc., must be caulked whether or not covered with wood or cement. This requirement must also be carefully attended to in way of auxiliary machinery such as donkey boilers, etc.

The butts of deck plating to be carefully shifted.

For the riveting, see Art. 27.

The plating of decks must not be cut by the bulkheads.

Compensation will be required to the satisfaction of the Surveyor for openings made in the decks. (See art. 20, §§ 4, 5 & 6.)

Plating of partial steel or iron decks to be carefully broken and tapered at each end into the respective stringers and tie plates. The gradual reduction in width to extend over  $1/12$ th of the vessel's length at each end.

#### WOOD DECKS.

§ 2. — Decks to be of teak, or selected pine, fastened to the beams by galvanized screw bolts and nuts. The breadth of all second and exposed deck planking not to exceed 6 inches; the deck planks of orlop decks, when exceeding 7 inches, to be double fastened. The thickness of wood decks is given in Tables N° 6.

For reductions allowed in spar-and awningdeck vessels, see Art. 10, §§ 5 and 6.

Where a wood deck is fitted in conjunction with a steel or iron one, it may be reduced half an inch in thickness but **in no place** shall it be less than  $2\frac{1}{2}$  inches.

When a wood deck has been reduced as allowed by the above rule, it must be bolted to the plated deck between the beams.

Scantlings of teak decks may be reduced half an inch from the tabular thickness, but the thickness must be in no place less than 2 inches.

Teak or greenheart is to be used for margin planks in vessels building under special survey and to be classed in the First division.

The planks of wood decks are in all cases to be laid with a satisfactory shift of butts, not less than three planks being worked between butts in the same frame space.

## ARTICLE 22

### DECKS.

— 62 —

The screw bolts for fastening wood decks to be carefully fitted and dowelled watertight, and such decks to be caulked to the satisfaction of the Surveyor with at least three threads of oakum.

At least 6 ins. of iron plating on each side of the break must be fitted to take the ends of deck planking which is cut at coamings or bulkheads.

Wood decks must be renewed when worn down to 75 % of their original thickness.

Decks over holds which are fitted with insulation for refrigerating purposes must be made thoroughly watertight.

### SCUPPERS AND FREEING PORTS.

§ 3. — Scuppers of sufficient size and number to be fitted to all decks; those of lower decks to have pipes leading to the bilges. These pipes to be protected by wood casings.

Holes are to be bored between frames in hold stringers and other longitudinal strengthenings when connected to the skin, to convey water or leakage from them to the bilges.

Freeing ports of any considerable size in passenger vessels must be fitted with gratings.

In vessels of the « welldeck » type, the freeing port

area in the well is to be in accordance with the following Table :

Length of bulwark in the well	Freeing port area on each side.
30 feet	9,5 square feet.
35 »	10 »
40 »	10,5 »
45 »	11 »
50 »	11,5 »
55 »	12 »
60 »	12,5 »
65 » and above.	one square foot to each 5 feet length of bulwarks.

### COAL BUNKER SCUTTLES.

§ 4. — The lids of coal bunker scuttles to be fitted watertight and properly secured.

### VENTILATORS.

§ 5. — All holds, tween decks, and coal bunkers, to have at least two ventilators — a downcast and an upcast — placed as near as possible to the ends of the compartments.

Ventilators to coal bunkers may be dispensed with if the hatches or coal shoots be fitted with gratings (as well as solid covers), unless the temperature of the bunker is likely to be affected by proximity to boilers, or other reason, in which case additional means of ventilation will be required.

A ventilator (mushroom, swan-neck, or other suitable

form) must be arranged and led into peaks and any place where gas is likely to accumulate.

All ventilators are to be led well above the weather deck, and extend to the crown of the compartment to be ventilated.

Instead of cowls on the upcast ventilators, one or more swan-necks, mushrooms, or similar arrangements, may be adopted, provided they are strongly fixed to the deck, and are at least 2 feet above the deck to the lowest part of the opening.

Downcast ventilators may be replaced by mechanical apparatus designed to supply fresh air to the compartments.

Tubes of hold ventilators passing through crew or passenger spaces must be gas-tight.

When holds or tween decks are used for the same species of cargo, ventilation of both holds and tween decks may be affected through the same cowl, the tween deck tubes being made smaller in diameter than the coaming to which the cowl is fitted. The ventilation of the tween decks is thus obtained through the annular space between the tube and the deck coaming.

All ventilators must be provided with efficient covers for use in bad weather.

Ventilator coamings are to be bolted or riveted to the deck, and made thoroughly watertight.

Their height above deck shall be from 2 feet to 3 feet, depending on their diameter, and their thickness not less than given in Table N° 9 for sides of deck-houses, with a minimum of 10/32 in.

For ventilators less than 16 ins. in diameter, the thickness of the cowl shall be about 4/32 in., and 6/32 in. for diameters greater than 16 ins.

The thickness of ventilating tubes in holds and tween decks to be the same as for the upper part of bulkheads, unless strongly cased in with wood.

#### GANGWAYS.

§ 6. — All gangways and ladders shall be not less than 19 ins. wide, and be fitted with at least one guard rail.

#### TOWING ARCS.

§ 7. — At the after end of tug-boats one or more towing arcs shall be fitted, portable or fixed.

### ARTICLE 23

#### WATERTIGHT BULKHEADS

§ 1. — Watertight bulkheads to be in thickness according to Table N° 2 and to be riveted between double frames. Single frames may be accepted for the attachment of

## WATERTIGHT BULKHEADS.

— 64 —

bulkheads, provided the width of both flanges be sufficient for double riveting.

They must be stiffened vertically on one side, and horizontally on the other, with angle bars of the same size as frames; the vertical stiffeners to be fitted not exceeding 2 feet 6 inches apart and continuously for the whole depth of bulkheads, while the horizontal stiffeners are to be spaced not more than 4 feet apart from the floors to the upper deck on the collision bulkhead, and to the second deck in case of all others. Other modes of strengthening and supporting bulkheads may be accepted, provided they be equally efficient.

The vertical stiffeners must be connected to the tank top and deck plating by knee plates or otherwise.

The horizontal stiffeners of bulkheads 40 feet wide and above are to consist of bulb angles of the size required for deck beams of same length fitted to even frame. (Tables N° 5.)

When bulkheads are 36 feet or more in width, vertical web plates of sufficient size are to be fitted in addition to the foregoing and carried up to the lowest tier of beams, viz: one central web for bulkheads 36 to 45 feet wide; two webs for a width of 45 to 55 feet, and three webs for a width of 55 feet and above. These web plates are to be well connected at top and bottom by double angle bars.

Where a deck is suppressed, adequate compensation must be provided at the same level for the stiffening of the bulkheads. An efficient girder is also to be fitted at the level of strong hold beams.

In vessels with a double bottom, double frame angles should be fitted on the tank top to stiffen the foot of watertight bulkheads. A single equivalent angle bar may be used provided the flanges are broad enough to take double zigzag riveting.

In vessels with the marks  or  (Art. 1, § 8) the stiffeners must be strengthened by bulbs or web plates and strong brackets.

Bulkhead liners of outside strakes of plating to extend from the frame before to the frame abaft the bulkhead, or efficient diamond plates to be fitted to outside strakes, unless otherwise compensated for. The system of compensation to be submitted for the approval of the Administration through the Surveyor. Particular attention is drawn to this point in vessels with joggled shell plating in which case special means must be adopted for maintaining the strength of the shell plating at the bulkheads. The proposed compensation must be submitted for the approval of the Administration.

If an outside strake is butted in way of a bulkhead liner a butt strap must be fitted in addition to this liner, but it

may be reduced in thickness to  $\frac{2}{3}$  of that which other wise should have been required.

The bulkheads are to be caulked and made thoroughly watertight.

When a bulkhead is stepped at a deck, no opening shall be allowed to exist in the watertight flat between the two parts of it, and watertightness must be secured round the frames without any cement or wood. The proposed arrangements to be submitted to the Administration for approval.

If bulkheads be more numerous than required by rule and efficiently constructed, due consideration will be given for same as regards transverse strength.

§ 2. — **All vessels** to have a collision bulkhead extending from the bottom to the upper deck in all cases, placed at a distance from the stem about equal to  $\frac{1}{4}$  of the vessel's length plus seven feet, to the satisfaction of the Surveyor. — This bulkhead is recommended to be strengthened by bracket plates connected to the outside plating.

It is also recommended that a similar bulkhead be fitted a short distance abaft the collision bulkhead.

In **sailing vessels** of 250 feet or more length, it is recommended to fit at least one watertight bulkhead about amidships, and in sailing vessels of 300 feet or more, two bulkheads.

Sailing vessels fitted with watertight bulkheads so that

each of the masts may be in a separate compartment will be entered in the Register with the special mark  $\square$  (See Art. 1, § 8.)

§ 3. — **Steamers** to have watertight bulkheads fitted at ends of the engine and boiler space extending from the bottom to the upper deck in all vessels excepting awningdeck vessels, where they may stop at the 2nd deck.

These two bulkheads to be stiffened by heavier angle bars and bulbs, on account of their being supported by the decks only on one side.

In steam vessels no compartment shall exceed 90 feet in length; exceptional cases will be considered on written application.

All bulkheads must be carried to the upper deck (to the 2nd deck in awningdeck vessels).

Cross bunkers in steamers of 36 feet or more beam to be divided by a longitudinal iron or steel bulkhead, to prevent the shifting of coals; and such a bulkhead in plate or in wood is recommended to be fitted in all sea going vessels of comparatively small dimensions.

§ 4. — **Screw steamers** to have one bulkhead aft at the inner end of the stern tube at a suitable distance from the propeller post, and specially stiffened in way of the stern tube to the Surveyor's satisfaction. A complete steel or iron flat with a manhole to be fitted, when this bulkhead does not extend to the upper deck (to the

second deck in awningdeck vessels), so as to form a watertight compartment.

§ 5. — Doors in watertight bulkheads to be as limited as possible in number and size, made perfectly watertight and worked from a deck situated above the load line.

Their watertightness must be tested by hose.

**No door to be allowed under any consideration in collision bulkheads.**

§ 6. — In all vessels building under survey the bulkheads must be tried with the fire-hose, to ascertain whether they are perfectly watertight; and in vessels already built where there is reason to doubt the efficiency of the watertight bulkheads, the same test should be applied.

The fitting of watertight doors, valves and cocks must be to the entire satisfaction of the Surveyor.

The after peak to be filled with water so as to test the connection of the stern tube to the bulkhead and stern frame.

In all vessels, the fore peak also to be filled with water, in order to test the strength and watertightness of the collision bulkhead.

## ARTICLE 23<sup>A</sup>

### PUMPS, PIPING, ETC.

§ 1. — HAND PUMPS. — In all vessels a hand pump worked from the upper deck shall be fitted to each

hold. When there is no double bottom, or where hold drainage wells are arranged between the tanks in the double bottom, the hand pump suction is to be placed at the after end of each hold at the middle line of the vessel. In vessels having a continuous double bottom without wells two hand pumps shall be fitted, one in each bilge.

The after peak, when not used as a ballast tank, may be drained into the tunnel well by a cock or sluice valve, but the fore peak must be fitted with a separate hand pump or steam suction.

No sluice valve or cock will be permitted on the collision bulkhead.

Suitable arrangements (hand pump in fore peak) to be fitted for dealing with drainage on the crowns of peak tanks.

The diameter of these hand pumps to be submitted for approval.

§ 2. — Instead of deck hand pumps to each hold, as required above, any other system of hand pumping, (such as one or more pumps of fly wheel pattern fixed and connected to the steam bilge system) may be adopted, provided it receive the sanction of the Administration.

The bores of pumps of this description to be as follows :

Tonnage under deck		Diameter of pump barrel
Under	1000 tons	4 ins.
Over 1000 and 2000	»	5 »
» 2000 » 4000		6 »
» 4000 » 6000	»	7 »
» 6000 »	»	8 »

Hand pumps are to be worked from the upper deck or from a deck whose level is above the deep load line and should be tested so as to ensure their efficient action. The « lift » of the pump should not exceed 24 feet.

§ 3. — Sailing vessels, having collision and no other bulkheads, shall be fitted with at least 2 pumps independent of that of fore peak.

The bores of the pumps should not be less than :

3 inches for vessels under 300 tons (under deck).
4 » » over 300 not exceeding 600 tons.
5 » » » 600 » 2000 »
6 » » » 2000 tons (under deck).

Sailing vessels with more than two watertight compartments shall have a suction pipe led to each hold from each of the two hand pumps above required.

In sailing vessels fitted with donkey boiler and winch it is recommended to connect same with the hand pumps by messenger chain or other suitable means.

#### STEAM PUMP SUCTIONS.

§ 4. — In steam vessels a steam pump suction shall

be fitted to each compartment — cargo holds, machinery spaces, or water ballast tanks, and peaks when used as ballast tanks.

§ 5. — BILGE SUCTIONS. — Where there is no double bottom, or where hold wells are arranged between tanks in the double bottom, one steam suction shall be fitted at the middle line in vessels whose longitudinal number is less than 62,000, and two suction one on each side of the middle line keelson when the numeral exceeds 62,000. In flat bottomed vessels, or in holds of unusual length a third suction may be required.

In vessels having a continuous double bottom without wells two steam suction will be required, one in each bilge.

A well should be fitted at the after end of the tunnel, into which a steam suction must be led.

As a rule, the diameter in inches of suction at centre line and in wings where no wells are fitted to be about  $0.45 \sqrt{B}$ , B denoting the breadth of the vessel in feet, but this may be modified in special cases.

When three suction are required, the wing suction (except in machinery space) may be one inch less in diameter than given by the above rules, but suction pipes should not be less than 2 ins. and need not exceed  $3 \frac{1}{2}$  ins. in diameter.

§ 6. — BALLAST SUCTIONS. — In double bottoms one

## ARTICLE 23<sup>A</sup>

### PUMPS, PIPING, ETC.

— 68 —

steam suction shall be fitted at the middle line of the vessel, and two, one on each side of the centre girder, if the length of the compartment exceed 55 feet or if the rise of floor be less than 1 in 15.

The diameter of these suction pipes in inches shall be

$.6 \sqrt[3]{V}$ , V denoting the capacity of the tank in tons.

Wing suctions may be one inch less than given by this rule. In any case however no suction pipe shall be less than 2 ins. in diameter.

A steam suction is to be led into the peaks when these are arranged as ballast tanks.

§ 7. — DEEP TANKS. — Deep hold tanks for ballast purposes may be filled direct from the sea through an efficiently constructed sea valve with a rod worked from the upper deck. Special precautions, however, such as lock and key, shall be fitted as a safeguard against water being accidentally run into the hold. A pump (preferably steam), separate from the bilge-pumps, should be fitted for dealing with the water ballast.

The number and size of suctions in deep tanks to be to the approval of the Administration.

§ 8. — SOUNDING AND AIR PIPES. — A straight sounding pipe extending to upper deck must be fitted in each

watertight compartment or well, and one in each wing when there is a double bottom with or without well.

Two sounding pipes will be required in compartments with little rise of floor. The shell plating under sounding pipes must be protected by a doubling plate.

Each water ballast tank must have a suitable number of air pipes of sufficient diameter, extending to the upper deck. The escape of the air to the air pipes should be made as easy as possible by cutting a number of holes of sufficient area in the floors and angles bars under the tank top or by any other suitable method.

§ 9. — FIRE SERVICE. — At least one of the steam pumps must be arranged with permanent connection to a fire service pipe system, led along the weather deck and fitted with nozzles for the attachment of hose pipes having sufficient length to be able to throw water into any compartment of the ship.

All vessels must have at least one portable fire pump with the necessary fittings.

§ 10. — GENERAL REQUIREMENTS. — The system of ballast pumps, piping, etc. must be entirely separate from the bilge system. If however a connection be required between them, it must not be made through less than two valves other than those in the distribution boxes.

The distribution boxes are to be conveniently placed

in accessible positions and a mud box should be fitted between them and the pump to which they are connected.

For further particulars as to arrangements in machinery space, see Art. 34, § 10.

All suction pipes to be accessible and carefully protected from possible injury in way of cargo holds and coal bunkers.

Lead pipes communicating with the sea to be fitted with cocks or valves at the vessel's skin, and all soil pipes to be connected to skin with wrought or cast iron elbows of good quality fitted with storm valves.

The thickness of all pipes to be to the Surveyor's satisfaction.

All suction pipes are to be led in to perforated strums placed in the bilge or bottom in the most suitable position for purposes of cleaning etc.

The area of the perforations in strums to be at least twice that of the suction pipe.

All sluice or flood valves, or cocks, must be worked by rods from the upper deck or in the machinery space and must be accessible.

Flood valves, arranged with lock and key, are to be fitted to all compartments reserved for the transport of explosives, inflammables, or other dangerous goods.

Four sunprints or a tracing on cloth of the pumping arrangement of steam vessels to be built under special

survey must be submitted through the Surveyor for the approval of the Administration.

Exceptional cases will have special consideration, and other arrangements of an equivalent efficiency may be adopted in lieu of above requirements.

All pumps to be tested to ensure their efficient action (see Arts. 3, § 6, 4, § 4, 6, §§ 4 & 34).

## ARTICLE 24.

### PLATING

§ 1. — The plating to be in accordance with Tables N° 1, for half the vessel's length amidships.

When alternate thicknesses of plating are specified in the Tables, the thinner plates in all cases to form inside strakes.

The plates to be not less than six frame spaces in length.

If the frame spacing be 25 % wider than by Table N° 1, the tabular thickness of shell plating (except keel, garboards, and sheerstrakes) shall be increased by 2/32 in. Smaller increases to be in proportion.

Table N° 1<sup>5</sup> gives the normal reduction from the midship thickness over one quarter of the length at the ends of the vessels; but the whole of the shell at ends, with the exception of the keel, garboards, bottom, and plating at the after end as described below, may be of a uniform thickness viz. that of the side plating at

## PLATING

— 70 —

ends as given by Table N° 1<sup>5</sup>. Garboard strakes and two strakes of bottom plating adjoining same shall be reduced at the ends not more than  $2/32$  in. from the midship thickness.

When a flat plate keel is used, the strakes adjoining it must be of the thickness required for garboard strakes and reduced not more than  $2/32$  at the ends.

No reduction from the tabular midship thickness will be allowed on the boss plates of screw steamers and the strakes below them or on furnaced plates at bow and stern, nor more than  $2/32$  of an inch on the two aftermost lengths of the plating, from the boss plate to the top of the propeller frame.

In vessels whose machinery is fitted in the after quarter, only 50 % reduction from the midship thickness given in Table N° 1<sup>5</sup> will be permitted on the shell plating aft up to the counter.

For the reduction at ends of flat plate keels, see Art. 11.

Reductions in thickness are to be made gradually, the difference in thickness between adjoining plates in the same strake is not to exceed  $2/32$  in.

§ 2. — If it is desired to enter a vessel in the Register with the special mark **P. R.** (See Art. 1; § 9) the bow plating from the stem to 2 frames abaft the collision bulkhead and from below the light water line up to 2 feet above the deep load line must be  $1\frac{1}{2}$  times the tabular thickness of

the midship plating, but need not exceed one inch. The thickness may be gradually reduced towards aft, in such a way that the decrease between two adjoining plates shall not exceed  $2/16$ ths of an inch.

For this same length, strength must also be provided for by a closer spacing of the frames which must be spaced not more than  $2/3$  of their tabular midship distance, and by additional stringers consisting of double keelson angle bars not more than 4 feet apart, connected by efficient breasthooks and panting beams.

In the case of vessels already built and intended to be strengthened in view of the mark **P. R.**, the bow plates may be doubled with plates of the same thickness as required by Table N° 1<sup>5</sup>, for the same length as above prescribed; and additional frames to be fitted, extending above and below the doubled strakes of plating, with breasthooks and panting beams as above.

A plan of the whole to be submitted to the Administration for approval.

§ 3. — Bulwarks shall have a height of at least 39 ins. in steamers, and 50 ins. in sailing vessels.

Bulwark plates to be in thickness the same as the upper part of bulkheads; and a sufficient number of water ports to be fitted in them. (See Art. 22, § 3.)

Bulwark stanchions should be spaced not more than six feet apart. Their diameter to be from  $1\frac{1}{4}$  to 2 in., according to their length.

If open rails be fitted instead of plate bulwarks, the

rails shall be pitched not more than 10 ins. apart, and stanchions not more than 54 ins.

In tugboats a strong fender shall be fitted at about the level of the deck.

§ 4. — All inside strakes of plating to be fitted and riveted close to the frames to which they are connected; the outside strakes to have solid lining pieces in one length, of the same breadth as frames, carefully fitted and riveted, metal to metal, between the plating and frames.

§ 5. — Butts of plating to be planed and fitted close metal to metal, and caulked so as to be perfectly watertight.

§ 6. — The breadth of sheerstrakes and of flat plate keels, to be as specified in Tables N° 1.

§ 7. — Butts of garboard strakes to be carefully shifted with each other and with the keel scarphs.

Butts in adjoining strakes of plating, stringers, &c., to be at least two spaces of frames apart, and there must be at least two clear strakes between two butts in the same vertical line.

For riveting see Art. 27.

§ 8. — Doors, side ports, freeing ports, hawse and mooring pipe holes, &c., cut in the shell plating and also openings in stringers to be compensated for by doubling plates, or any other means approved by the Administration.

Freeing ports of any considerable size in passenger vessels must be fitted with gratings.

Strong watertight covers or plugs must be provided for any openings in shell, bulwarks, or weather decks.

Side lights in sheerstrakes to be avoided as far as

practicable; but when such are necessary, compensation for same must be carefully attended to.

The use of cast iron for side light frames will not be permitted.

Sidelights are to be supplied with solid deadlights, hinged or portable; and those at the fore end of the vessel should be protected by iron guard bars against damage from anchor or cable.

All details in connection with freeing ports, etc., to be submitted to the consideration and approval of the Administration.

§ 9. — **When a continuous double bottom is fitted** the shell plating entirely within the double bottom may be of the thickness given in Tables N° 1 for side plating. No reduction will be allowed on flat keel plates and on the plates adjoining these, or on garboard strakes. (See art. 11, § 4.)

Care is to be taken that the reductions stop at a reasonable distance from the waterballast ends and that a proper shift be made with the non reduced plates.

## ARTICLE 25.

### WATERBALLAST.

DOUBLE BOTTOM WITH BRACKET FLOORS ON ALTERNATE FRAMES.

§ 1. — The scantlings and other particulars of cellular double bottoms are given in Table N° 4.

The centre keelson or bearer must be of the depth and thickness given in the Table, attached to the tank top by

## ARTICLE 25

### WATERBALLAST.

— 72 —

double longitudinal angle bars of the size specified and to the flat plate keel, if such is fitted, by two keelson angle bars. (Tables N° 3.) The centre bearer must be stiffened by bracket plates at each frame where no solid or bracket floor is fitted.

The margin plates are to be connected to the skin by a longitudinal angle bar of the size specified in the Table; the butts of this bar are to be fitted with buttstraps.

The side framing is to be bracketed to the margin plate by bracket plates of the same thickness as the tabular frames, carried up the bilge to a height at least equal to twice the tabular depth of ordinary floors. Inside the double bottom, bracket plates, connected to the shell and tank top, are to be riveted to the margin plate where no solid or bracket floor is fitted.

Continuous side keelsons or bearers as per Table must be fitted in the double bottom, not more than 4 feet apart, and attached to the tank top and to the outside plating by single angle bars of the size given in the Table.

For riveting see Art. 27.

Frames and reverse frames to be fitted throughout double bottoms, of the tabular scantling and spacing. But the vertical flange of frames on solid floors may be of the same width as shell flange.

On every alternate frame intercostal floor plates having

the full depth of the double bottom must be fitted; these may be formed of bracket plates, or solid plates with manholes. The size of manholes to be so limited as to leave a clear plate surface all round, equal at least to  $2\frac{1}{2}$  times the depth of the vertical flange of tabular frame angles. Solid plates with manholes to be fitted in all cases where the scantling numeral exceeds 450,000. These intercostal floor plates to be of the same thickness as the side bearers, and attached to them and to the tank top by angle bars of the size required for the side bearers. **In the engine compartment**, bracket plates will not be allowed, but full plate floors must be fitted to every frame.

In the boiler compartment, full plate floors with manholes are to be fitted to every alternate frame.

No manholes to be cut in the centre keelson, and those in the side bearers to be properly shifted with each other as well as with the bearer and the tank top butts.

The second floor from the after end of the engine compartment should be made solid and watertight, in order to form a drainage well or the bilge water, and manholes to be cut in the tank top at this well, where required.

In this system of construction floors must be fitted to every frame for 15 % of the vessel's length abaft the fore peak bulkhead or equivalent stiffening to the approval of the Administration.

## DOUBLE BOTTOM WITH DEEP FLOORS ON EVERY FRAME

§ 2. — When the double bottom is constructed with deep floor plates fitted to every frame and running in one length from the middle line to the margin plates, the thickness of these floors to be the same as required for side bearers in Table N° 4.

About midway between the centre keelson and margin plate, intercostal bearers are to be fitted  $1/16$ th of an inch thicker than the floors, and well connected to the latter and to the tank top and shell plating by angle bars as per Table. Two intercostal bearers of same thickness as floors will be required when the breadth at tank top exceeds 34 feet, and three when that breadth exceeds 48 feet. Additional girders shall be fitted in way of the machinery.

The vertical flange of the frame angles within the double bottom may be of the same width as the shell flange. The flanges of the reverse bar may be the same as those of the frame, and of a thickness equal to that of the floor.

A sketch of the engine foundations should be submitted for approval.

It is recommended that this system of construction be adopted in vessels in which no centre pillars are fitted.

For other particulars, see §§ 1 & 5.

## WATERBALLAST COMPARTMENTS BUILT ON ORDINARY FLOORS

§ 3. — The tank top to be of the thickness given in Table N° 4 ; but it need not be more than  $6/16$ ths of an inch, except the line middle plates and the side plates connecting the tank top to the hull, which must in all cases be  $1/16$ th of an inch thicker.

The centre-bearer may be  $1/16$ th less in thickness than that of cellular double bottoms ; it must have double angle bars top and bottom, as per Table.

The side bearers may be  $1/16$ th less in thickness than the centre bearer ; they should not be more than 4 feet apart, and must be connected to the structure, top and bottom, by longitudinal angle bars as per Table.

The double bottom to be well strengthened athwartships by brackets or otherwise.

For riveting see Art. 27.

When longitudinal supports are fitted as described above, the sister and lower bilge keelsons may be dispensed with, if approved of by the Administration ; but if the tank does not extend the entire length of the vessel, the centre bearer must scarph the centre keelson and the sister and bilge keelsons must be continued at least 3 spaces of frames into the tank to the satisfaction of the Surveyor.

**WATERBALLAST.**

## WATERBALLAST HOLDS OR DEEP TANKS.

§ 4. — In deep hold tanks which extend to the upper deck the stiffening and thickness of the end bulkheads shall be generally as required by Art. 36 Table D, or equivalent thereto. If however the crown of the tank be at the height of the hold beams only, the thickness of the bulkhead plating may be as required by Table D, for the middle third of bulkheads and stiffened with web plates and bulbs. In all cases an iron or steel deck is to be fitted on the top of the tank, the requirements as to thickness etc. being as per Tables N° 6 and Art. 22, § 1. It is recommended that a longitudinal watertight bulkhead be fitted in all deep tanks, well stiffened and connected at the boundary by double angles. For the connection of hold stringers and keelsons to bulkheads see Plate F, Art. 36.

For riveting see Art. 27. It is to be noted however that if the stiffening be arranged altogether inside the tank the spacing of rivets in all stiffeners should not exceed 5 to 6 diameters centre to centre and plate stiffeners are to be connected to the bulkheads by double angles.

A plan of the arrangement is to be submitted for the approval of the Administration, as also of any special disposition of waterballast tanks.

## GENERAL REQUIREMENTS.

§ 5. — When the double bottom extends under the engines and boilers, the floors under the boiler bearers and under the engine seating must be increased 1/16th in thickness; the tank top in the engine and boiler space, as well as in the cross-bunkers, is to be increased as specified in Table N° 4. Where the foundation or sole plate of the engines rests direct on the tank top, the thickness of the latter shall be twice the thickness of the engine room tank top plating. The bolts for holding down the bed plate are to be tapped into the thick plating with grum mets and washers underneath the heads. The tank should be retested after the bed plate is fitted in place. When ordinary or deep floors are fitted, the longitudinal girders must be strengthened or their number increased to the satisfaction of the Surveyor.

Floors which are cut at the centre girder must be connected thereto, when more than 3/5ths the width of the midship floor, by double angles on each side if breadth of ship exceeds 42 feet; by single and double angles alternately when breadth of ship is between 36 and 42 feet, except in machinery space and coal bunkers where they must be double in all cases.

The knees connecting the frames to the margin plate

are to have a height at the bilges at least equal to twice the height of the tabular floors.

Web frames to be connected to tank margin plate by double angles, or gusset plates fitted.

In vessels of or over 22 feet in depth every fourth and in those of 29 feet or more every second frame-bracket is to be connected to the tank margin plate by double angles fore and aft, or equivalent compensation provided. In vessels of the single deck type these limits will be 19 feet and 26 feet respectively.

A well is recommended at the after bulkhead of the engine compartment, and manholes cut into the tank top over it and fitted with watertight covers. A similar well is strongly recommended for the other compartments whenever a slight accumulation of bilge water might cause its overflowing the flat inner bottom.

When the margin plates in way of such wells have holes cut in them to admit the bilge water into them, valves or cocks must be fitted to same, capable of being worked from a deck or platform above the deep load line.

The boilers should be not less than 12 inches clear of the tank top.

Special care must be taken to ensure the accessibility of all parts of the tank top in way of the engines and boilers.

Engine and boiler seats or bearers must in no case be bolted through the tank top, but riveted to it.

Manholes to be arranged in every space between longitudinal bearers, to allow of all parts being examined.

Manholes for entrance to the double bottom should be not less than 18 ins. by 12 ins. and be compensated for.

§ 6. — For requirements as to suction and pipes, see Art. 23A, § 6.

The piping for emptying the waterballast tanks or holds must be arranged in such a way that the water can be pumped out entirely, even when the vessel has a heavy list.

Double bottoms to be subdivided into a sufficient number of transverse watertight compartments, so as to ensure stability whilst filling or emptying the tanks.

§ 7. — Double bottoms to be tested, before launching, with a head of water corresponding at least with the load draught of the vessel, and to be perfectly watertight. Peak and deep hold tanks are to be similarly tested. In any case the head of water must not be less than eight feet above the crown of the tank.

The bottom of the vessel to be covered with cement inside the tanks, and also the gutters formed by the tank sides, if so constructed. The tank top to be cemented in engine and boiler rooms and to be covered with a wood ceiling elsewhere. For particulars of this ceiling see Art. 28.

§ 8. — For the reduction allowed on the bottom plating see Art. 24, § 9.

## ARTICLE 26.

## SCREW SHAFTING TUNNEL.

§ 1. — The plates of screw shafting tunnels to be not less in thickness than that prescribed for the lower part of bulkheads, and to be strengthened by reverse angle bars spaced from 4 to 5 feet apart, or in any other way to the satisfaction of the Surveyor.

Under the hatchways, tunnels must be sheathed with wood or doubled with steel or iron plates; or the thickness of plating must be increased by one-half.

Where masts are stepped on the tunnel efficient local strengthening will be required.

§ 2. — Tunnels must be watertight throughout, metal to metal, and tested by hose as in the case of bulkheads.

Drain pipes may be fitted to the bottom of tunnels.

A well should be fitted at after end. (See Art. 23, § 11.)

All tunnels to have a watertight door on forward end at the entrance from engine room, which must be arranged to open and shut from a deck above the load water line.

The shaft where carried through the after bulkhead of engine room, to be fitted with a suitable stuffing box with deep packing gland.

The height and breadth of the tunnel to be amply sufficient to allow of easy access for removing or repairing the shaft.

## ARTICLE 27.

## RIVETS AND RIVETING.

§ 1. — The holes to be regularly pitched and carefully punched opposite each other, from the faying surfaces.

The countersinking of the outside plating and stringer plates, to be made by drill, and to extend at least through two-thirds the thickness of the plate.

Rivets in the outside plating to be laid up round the heads, to fill the holes and countersinks, and to be finished flush on the outside.

Keel rivets should be left full or convex.

The diameter of **rivets** and the breadth of laps are given in Table N° 7 for steel and for iron vessels; also the dimensions of buttstraps.

The diameter given in Table N° 7 is that of the rivets as manufactured and before they are heated, and the plates or bars must be punched to suit that diameter.

The diameter of rivets and the system of riveting is to be regulated by the thickest of the plates to be connected.

The diameter of rivets for attachment of frames and reverse frames to the plating is to be regulated by the greatest thickness of the attached plates.

## SPACING OF RIVETS.

§ 2. — The spacing of rivets in each row shall be as follows :

1°  $3\frac{1}{2}$  diameters for single and double riveted butts, and for the two inner rows of treble riveted buttstraps with single straps ; also for single riveted seams of shell plating, butts and seams of watertight bulkheads, double bottom, etc.

2° 4 diameters for single riveted seams of decks, double riveted seams of shell and double bottom ; also for treble riveted overlapped butts.

3°  $4\frac{1}{2}$  diameters for butts with double straps treble riveted, and double riveted seams other than shell and double bottom ; also for quadruple riveted butts.

4° 5 diameters for forgings and for the connections of floors and frame brackets to centre girder and tank margin plates ; for engine and thrust seating and framing immediately below same ; also for beam knees. At least four rivets to be put in each knee, one of which, in the case of plate knees, is to pass through the beam itself.

5°  $5\frac{1}{4}$  diameters for the third row of treble riveted butts with single straps ; and for the connection of shell to framing and stringers, from keel to load line

for about 20 % of length from stem when the numeral exceeds 250,000.

6° 7 diameters for the connection of frames and reverse frames to each other and to floors or shell plating, also angle bars of beams, keelsons, hold stringers, bulkhead stiffeners, etc.

7° 8 diameters for stringer plates and deck plating to beams.

§ 3. — In chain riveting the distance from centre to centre between the rows to be at least three times and in zigzag riveting at least twice the diameter of the rivet. In no case shall the centre of a rivet be nearer the edge of the plate or bar through which it passes than one and a half times its own diameter.

## SYSTEM OF RIVETING FOR LONGITUDINAL SEAMS.

§ 4. — The spacing, diameter and system of riveting regulated by the thickness of plating amidships, is to be continued all fore and aft.

The longitudinal seams of plated decks may be single riveted ; but in vessels of 400 feet and above, the inner edge of the stringer plate must be double riveted.

If the **bottom** plating is of or over  $11/32$ ds of an inch, for steel,  $13/32$ ds for superior iron or  $7/16$ ths for ordinary iron, the longitudinal seams must be double riveted

## RIVETING

to the upper turn of the bilges, and if the **side** plating (including spar and awning deck topsides), is of or over 14/32ds, 16/32ds or 9/16ths respectively, all longitudinal seams of outside plating to be double riveted throughout.

The seams of shell plating to be chain riveted; zigzag riveting will only be allowed on the condition that every care shall be taken to secure a good connection of the frames with the outside plating, as well as a perfect watertightness of butts.

The seams of sheerstrakes and of flat plate keels to be double riveted when the adjoining plating is of or over 11/32ds, 13/32ds or 7/16ths of an inch respectively as above.

The longitudinal seams of tank top plating may be single riveted, but those of the centre strake and margin plates shall be double riveted whenever these plates are of or over 15/32nds in thickness.

## SYSTEM OF RIVETING FOR BUTTS.

§ 5. — 1° With **iron** rivets, overlapped butts or butts with single straps shall be double riveted when the plates are under 13/32nds., treble riveted when of or over 13/32nds, and quadruple when of or over 19/32nds. When of or over 24/32nds double straps treble riveted shall be used.

2° With **steel** rivets these limits shall be 14/32nds, 21/32nds, and 28/32nds respectively.

The above rule applies more particularly (for half length amidships) to upper, main, spar or awning deck sheerstrakes, stringers and deckplating and all topside plating above main deck, also to keel plate, garboards bridge plating and bilges. In its application to midship side and bottom plating with iron rivets, the thickness may be reckoned at 80 % and for plating at ends the thickness may be reckoned at 65 % of the actual thickness amidships (without the reduction for double bottom allowed by Art. 24, § 9). For **steel** rivets these percentages shall be 90 and 75 respectively.

§ 6. — The riveting of butts of shell plates over 58ins. in width is to be specially considered and submitted for the approval of the Administration.

§ 7. — In steam vessels whose machinery is placed aft the shell butts shall be treble or quadruple riveted at the after end if the same be required amidships.

§ 8. — Treble riveting at least will be required for the butts of the first side plates in poops and raised quarter decks as well as those at the ends of bridge-houses.

In screw steamers when treble riveting is required amidships treble riveting will likewise be required

for the three aftermost butts in each strake of outside plating from the keel to at least the height of the deep water line.

§ 9. DOUBLING PLATES. — The butts of doubling strakes as well as those of doubled strakes to be fitted with buttstraps directly over the butts and riveted in accordance with the above rules. These plates should be well riveted together on their edges and by a sufficient number of additional rivets in every frame space.

§ 10. — The butts of floor plates, centre plate keels and keelsons shall be riveted with double straps or overlaps in accordance with the above rules for iron rivets.

§ 11. — Butts of deck plating at ends where of or under 10/32nds may be single riveted likewise those of tank top outside machinery space where of or under 11/32nds.

Butts of bulwark plates when of or under 8/32nds may be single riveted.

#### BUTTSTRAPS.

§ 12. The breadth and thickness of buttstraps to be in accordance with Table N° 7.

The buttstraps of sheerstrakes to be in one length, unless the sheerstrake projects sufficiently above the stringer angle to receive two rows of rivets vertically above this angle bar. In this case the buttstrap may be

interrupted, but the part above the stringer angle must be increased 1/16th of an inch beyond the tabular thickness.

When double buttstraps are required, the thickness of the one which is caulked must be 70 % and of the other 60 % of that given in Table N° 7.

When steel buttstraps have punched rivet holes, they ought to be annealed after punching, unless it be preferred to increase their thickness beyond that prescribed in the Table, or to rime the holes after punching.

For buttstraps in connection with bulkhead liners, see Art. 23, § 1.

§ 13. For riveting of masts see Art. 30, § 10.

### ARTICLE 28.

#### CEILING.

§ 1. — The bottom of vessels to the upper turn of the bilge, to be close ceiled with wood and the ceiling to be secured by bolts and nuts to the reverse frames. The ceiling of the flat of the bottom and of the waterballast tank tops to be laid in hatches.

The ceiling of waterballast tank tops to be laid on bearers. No through bolts connecting wood bearers directly with the tank top will be allowed.

From the bilge upwards to upperdeck the sides of holds to be sparred.

## ARTICLE 29

### RUDDER, WINDLASS, ETC.

— 80 —

The latter arrangement will not be required in vessels built for and employed in the coal trade.

The thickness of the ceiling to be as per Tables N° 3.

## ARTICLE 29.

### RUDDER, WINDLASS, &c.

§ 1. — FRAME. Rudder frames may be of iron or steel forged solid in one piece, and of the best quality.

Frames of cast steel may be used provided the material fulfils the requirements of Art. 33, § 9.

§ 2. — STOCK. The stock may be made in one with the frame or may be united thereto by a large coupling with a sufficient number of bolts and a key. It shall be turned from the head to below the rudder trunk and shall pass through a stuffing box or other suitable bearing fitted on the deck.

The diameter of rudder stocks to be in accordance with Table N° 1. For steamers these diameters are to be considered as the smallest allowable in slow speed steamers such as ordinary cargo boats. For steamers of higher speed the diameter is to be determined by the following formula :

$$d = 0,18 \sqrt[3]{a b^2 v^2}$$

where

$d$  is the diameter in inches

$a$  the immersed depth of the rudder in feet

$b$  the extreme breadth . .  $d^\circ$  . . . . .  $d^\circ$

$v$  the speed in knots per hour

but the diameter so calculated shall not be less than given by Table N° 1.

§ 3. — PINTLES. The spacing of pintles should not exceed from 4 feet to 5 feet 6 inches apart top to top.

Their diameter is to be as required by Table N° 1. It is recommended to make them independent of the rudder frame, care being taken to thoroughly secure them in the frame gudgeons. A liner is recommended to be fitted in the gudgeons, in which case the thickness of the gudgeon outside the liner is to be 1/2 the diameter of the pintle, otherwise the thickness should be 2/3 the diameter of pintle, and the depth of gudgeon 1 1/4 times that diameter.

§ 4. — RUDDERS WITH FRAME BETWEEN TWO PLATES. The main piece of the frame is to be tapered gradually from the stock to the heel where its sectional area may be 45 % that of the stock. Transverse stays 4 feet to 5 feet 6 inches, apart are to be fitted between the main and after pieces of the frame. The after piece may be gradually tapered from where it joins the

stock and from the heel towards the middle where its thickness shall not be less than from 1 inch to 1 1/2 inches according to the size of the rudder. Its breadth shall be about 60 % of the diameter of the rudder stock with a minimum of 3 inches.

The thickness of the side plates is to be 2/32 in, more than the lower part of bulkheads and butts arranged so as to come on transverse stays.

Double riveting is recommended all round the rudder frame especially in high speed steamers.

Rivets shall be spaced 5 diameters apart centre to centre. Their diameter need not exceed 1 inch.

§ 5. — SINGLE PLATE RUDDERS. — The thickness of the plate shall be one-eighth the diameter of the rudder stock, with a minimum of 5/8 in. and maximum 1 3/8 in.

The main piece shall be gradually tapered from the stock to the heel where its sectional area may be 55 % that of the stock. A groove should be cut in this main piece to take the edge of the rudder plate.

For pintles see § 3. An arm either shrunk on to the main piece or made in one with same is to be fitted at each pintle and extend over the full breadth of the plate on one side and the other alternately.

The sectional area of each arm where it joins the main piece shall be 50 % that of the rudder stock and

may be gradually tapered towards its outer end where its thickness may be equal to that of the rudder plate.

If stays be arranged so that there is one in way of and one between each pintle, on one side of the plate and the other alternately, the area at the main piece may be 35 % that of the rudder stock and the thickness of the rudder plate one-ninth the diameter of the stock with a minimum of 1/2 in. and maximum of 1 1/8 in.

§ 6. — BALANCED RUDDERS. When balanced rudders are adopted having about one-third of their area before the axis, the rudder stock at the head may be reduced to 85 % of the diameter otherwise required. The diameter at the neck bearing shall be 20 % greater than and that of the heel bearing may be 30 % less than the tabular diameter of the rudder stock. The depth of the heel bearing shall be not less than its own diameter and of the neck bearing 1 1/2 times its own diameter. The main piece shall be gradually tapered from the neck bearing towards the heel and from the neck bearing upwards into the stock.

The above proportions are intended for rudders in which the depth of gap between the neck and heel bearings is about 24 times the tabular diameter of rudder stock.

## ARTICLE 29

### RUDDER, WINDLASS, ETC.

— 82 —

For the spacing and dimensions of stays also thickness of plate see preceding sections.

§ 7. — GENERALLY. The rudder should be so fitted that it can be shipped and unshipped afloat. Stops shall be fitted both on the deck and on the rudder itself or sternpost to stop the rudder at from  $35^{\circ}$  to  $40^{\circ}$  from the middle line. A plan of the rudder arrangement shall be submitted to the Administration for approval.

§ 8. — The steering gear should be so placed that the helmsman's look-out, both ahead and abeam, may be as unobstructed as possible.

Steam steering gear should be fitted to all steamers of more than 800 tons gross and 500 I. H. P. A special pipe is to be fitted for supplying steam from the boiler to the steering gear.

The steering gears, including rods and chains, tillers and quadrants, leading and other blocks, are to be approved by the Surveyor, and spare steering appliances are to be provided complete and ready for use in case of need.

For a radius of quadrant  $= 6(D + 2)$  the diameter of steering chain shall be equal to  $\frac{D+1}{8}$ , and of steering rod  $\frac{D+1}{6}$ , D being the diameter of rudder head in inches.

The quadrant must be a good fit and be strongly keyed to the rudder head.

The eye shall have a depth equal to D and outside diameter 1.8 D.

Bolt connections in the leads shall have a diameter at least equal to that of the steering rod.

Ropes of any kind (wire or other) will not be permitted for the leads of steering gears, although wire rope may be used for the control of the steering engine.

§ 9. — Steam vessels of over 400 tons, and sailing ships fitted with a donkey boiler, should have a direct acting steam windlass, or windlass worked by messenger chain from a steam winch, of power proportionate to the weight of anchors and cables.

Steam pipes to windlass and winches should be placed on chairs fitted on the top of the deck.

Windlasses, capstans and winches are to be of an approved pattern or description, well bolted to deck in a thoroughly watertight manner.

The windlass, in any case, is to be capable of being worked by hand power.

The deck in way of same is to be carefully stiffened by beams, plating and pillars to the Surveyor's satisfaction (See Art. 16, § 11).

The beams in way of winches, windlass, cranes, capstan, etc., should be plated over with plating of the same thickness as stringers or tie plates (see Art. 19, § 3).

## ARTICLE 30.

## MASTS AND SPARS, RIGGING, ETC.

§ 1. — Plans showing the dimensions scantlings and construction of all iron or steel masts and spars are to be submitted for the approval of the Administration.

§ 2. — The diameter and scantlings of **steel and iron lowermasts** are given in Table N° 10<sup>2</sup> (masts without anglebars) and in Table N° 10<sup>3</sup> (masts with anglebars). The length given in the first column is to be used for square-rigged masts of sailingvessels, mizzenmasts excepted; in the second column for square-rigged masts of steamers, square-rigged mizzenmasts of sailingvessels and fore and aft rigged masts (mizzenmasts excepted) of sailingvessels, in the third column for fore and aft rigged masts of steamers and fore and aft rigged mizzenmasts of sailingvessels. The length for the tables in all cases to be measured from the top of upperdeck, beams (second deck in awningdeck ships) to the hounds. All lowermasts of 44 feet in length and above must be constructed with angle stiffeners extending over the whole length of lowermast.

At least three stiffeners must be fitted if the masts be made with 2 or 3 plates in the round and four if

there be 4 plates in the round. The scantlings of these stiffeners are given in Table N° 10<sup>3</sup>, but in no case need the thickness exceed that of the plating at the partners.

§ 3. — Masts supporting derricks intended for lifting heavy cargo such as boilers, pieces of machinery etc. shall be strengthened beyond the rule requirements to the satisfaction of the Administration.

§ 4. — The diameter and scantlings of **topmasts** are given in Table N° 10<sup>4</sup>, the regulating length being measured from the lowermast cap to the topmast hounds. If in square rigged masts this length is over 21 feet two angle stiffeners are to be fitted over the full length of topmasts; the width of flanges of these anglebars to be  $\frac{1}{5}$  of the diameter at heel of topmast, their thickness to be same as thickness of topmast at heel.

§ 5. — In the case of **polemasts** (lowermasts and topmasts in one piece) the diameter and scantlings of the lowerpart is given in Tables 10<sup>2</sup> and 10<sup>3</sup>, the length being taken from deckbeams to hounds as in § 2, but whenever the length of polemasts measured from beams of upperdeck (second deck in awningdeckvessels) to topmast-hounds exceeds 44 feet three angle stiffeners (not less than  $2 \times 2 \times \frac{7}{32}$  in size) should be fitted, even if not required according to Table N° 10<sup>2</sup>. Table 10<sup>4</sup> give

## ARTICLE 30

### MASTS AND SPARS, RIGGING, ETC.

— 84 —

the diameter and scantlings of the upper part of polemast regulated by 70 0/0 of the length from lowermast hounds to topmast hounds. Where required the diameter at lowermast hounds to be increased so as to suit the diameter at lowermast-wedging and topmast hounds. All angle stiffeners fitted to the lowerpart of polemasts are to be carried up to topmasthead, and the cutting of any of these for the admission of sheaves or otherwise must be compensated for.

§ 6. — The diameter and thickness of plating at lowermast hounds must in no case be less than what is required by the tables for the topmast at heel, and the diameter of a mast at truss hoop shall not be less than the greatest diameter of corresponding yard.

The taper in the thickness of mast and spar plating from the deck or slings to the ends must be gradual.

§ 7. — The diameter and scantlings of steel and iron **yards** are given in table N° 10<sup>4</sup>, the regulating length being the total length of the yard excluding the arms. It is recommended that yards over 20 ins in diameter be strengthened by angle bars, one to each plate in the round.

§ 8. — The diameter and scantlings of **bowsprits** are given in table N° 10<sup>5</sup>. When bowsprits are built to take a flying jibboom the regulating length, given in

column 1 of table N° 10<sup>5</sup>, is to be measured from the gammoning to the cap. If the bowsprit and jibboom are in one piece, the regulating length, given in column 2 of the table, is to be taken from the gammoning to the end of jibboom.

§ 9. — Doubling plates 5 ft in length are to be fitted right round masts at the wedging, similar plates 1 ft long are to be fitted at the heel.

Topmast plating is to be doubled over a length of not less than 2 ft in way of lowermast cap. Fid and sheave holes in topmasts are to be compensated for by doubling plates or other equivalent strengthening.

Plating of yards is to be doubled in way of the truss hoops.

Bowsprits at the gammoning are to have the plating doubled, and to be further strengthened by a vertical central diaphragm plate connected by four angle bars.

Cheeks of lowermasts are to be made of plates 4/32nds thicker than mast plates at partners and to be strengthened on the fore edge by a bulb bar or other means and on the upperedge by an angle bar worked round the mast; the flanges of this bar to be 1/2 inch wider and 2/32nds thicker than mast anglestiffeners given in Table 10<sup>3</sup>.

§ 10. **Riveting.** — Seams of lowermasts, bowsprits,

and polemasts constructed with angle bars, and of top-masts and yards may be single riveted.

Seams of lowermasts without anglebars must be double riveted and of polemasts without anglebars must be double riveted to above the lowermast hounds.

Butts of lowermasts, topmasts, bowsprits (outside wedging) and polemasts must be treble riveted. The butts or laps of fore and main yards to be treble riveted for one fourth the length in the middle. All other butts of masts and spars to be at least double riveted. All buttstraps to be  $1/16$  inch thicker than the plates they connect.

§ 11. — The diameters of wood masts and spars for sailing vessels are given in Table N° 10<sup>1</sup>.

§ 12. — All forgings, attachments and gear for, or connected with masts, spars and rigging to be made and fitted to the Surveyor's satisfaction.

Chain plates, ring and eye plates or bolts for standing and running rigging, to be fitted and attached to sheerstrakes by rivets of sufficient diameter and number, to the satisfaction of the surveyor.

All wire rigging and rigging chains to be tested, and test certificates to be produced asper Art. 33 E, § 11, and Tables N° 12.

## ARTICLE 31.

### PAINTING AND CEMENTING.

All iron and steel parts of the hull, with the exception of those which have to be caulked, should be painted with at least one coat of red lead. Before applying the red lead, the mill scale should be carefully removed from the surface of the iron or steel. The iron work so coated is to receive ultimately at least two coats of good oil paint, both inside as well as outside the hull. It is recommended to coat the bottom outside to above the light load line with composition of good and approved quality.

The bottom plating, frames, and inside riveting, to the middle of the turn of bilge on each side, and in the peaks, to be carefully cleaned and coated with Portland or other suitable protective cement which is to be properly worked to the level of the limber holes, or the lower drain holes punched in the frames.

Cement wash is recommended instead of paint for the inside of waterballast tanks, but the shell plating and rivet heads both inside the tank and in the bilges must be coated with cement to the level of the limber holes as above described.

Special means should be adopted to prevent wasting of the tank top framing and floors in machinery spaces, especially in way of boilers.

## INCREASED SCANTLINGS

FOR

## VESSELS OF EXTREME PROPORTIONS

## ARTICLE 32

§ 1. — Vessels whose length exceeds 12 times their depth or 7 times their beam will be subject to additional scantlings and strengthenings over those prescribed in the foregoing Rules and in the Tables N° 1 to 6.

Where additions are required in respect of both breadth and depth, the maximum of the two augmentations only will be required.

## PROPORTION OF LENGTH TO DEPTH.

§ 2. — The augmentations to stringer plates and sheerstrakes to be applied as follows, viz :

1° — In one, two and three-deck vessels, to the upper deck sheerstrake, and to the strake immediately below it ; also to the upper deck stringer plate and to the deck plating strake next to it.

2° — In spardeck vessels, to the spar and second

deck sheerstrakes and to the strakes between these two sheerstrakes ; also to the second deck stringer plate and so the adjacent deck plating strake.

3° — In awningdeck vessels to the second deck sheerstrake and to the strake immediately below it ; also to the second deck stringer plate and to the adjacent deck plating strake.

The augmentations on bilge strakes, keelsons and hold stringers, are to be applied in the same way in all types of vessels.

For the depth regulating the augmentations for extreme proportions see Art. 10, §§ 3, 5 and 6.

All particulars about requirements for extreme proportions of length to depth are contained in Table N° 14.

The increased thicknesses required by the said Table shall be applied to iron materials as well as to steel.

**PROPORTION OF LENGTH TO BEAM.****VESSELS EXCEEDING 8 BEAMS.**

§ 3. — Vessels over 8 and not exceeding 9 beams in length, and whose numeral is 125,000 and above, to have the following augmentations :

The upper deck sheerstrake to be increased  $\frac{1}{16}$ th of an inch in thickness, for half the vessel's length amidships and one bilge strake to be increased  $\frac{1}{16}$ th of an inch in thickness.

**VESSELS EXCEEDING 9 BEAMS.**

Vessels over 9 and not exceeding 10 beams in length, to have the following augmentations:

The second deck sheerstrake to be increased  $\frac{1}{16}$ th of an inch in thickness, for half the vessel's length amidships, when the numeral is under 125,000, and  $\frac{2}{16}$ ths when the numeral is 125,000 and above; also an increase of

$\frac{2}{16}$ ths of an inch in thickness, divided over the bilge strakes, for half the vessel's length amidships.

Vessels of the II Division whose numeral is over 160,000, to have in addition to the above requirements an increase of  $\frac{1}{16}$ th of an inch in thickness, on alternate strakes of bottom, bilge and side plating, for  $\frac{1}{3}$ rd the vessel's length amidships.

**GENERAL INSTRUCTIONS.**

The additional thickness of plating through increased scantlings must in all cases be properly scarphed with the smaller tabular scantlings, and the mean length of all the required increases must correspond with the specified length.

For vessels exceeding the foregoing proportions, a specification of scantlings must be submitted for the approval of the Administration, through the resident Surveyor.

---

## ARTICLE 33

### QUALITY AND TESTS OF MATERIALS.

— 88 —

## QUALITY AND TESTS OF MATERIALS

---

### ARTICLE 33

1. — All material used for ships or boilers under the survey of the Bureau Veritas, shall be of the best quality, tough and malleable; and in vessels for which the special survey mark is required, the whole shall be submitted to the tests hereafter described, in the presence of a Surveyor to the Bureau Veritas.

These tests shall take place as far as possible at the works of the manufacturers, who are requested to afford the Surveyor every facility for carrying out the work of testing, and furnish him with a signed certificate stating the process by which the material has been manufactured.

The test requirements given below for steel apply only to steel manufactured by the open hearth process, acid or non-acid.

When steel by any other process is proposed, its

employment must be sanctioned by the Administration, after special tests have been made as to its suitability.

In the United Kingdom the tests of the British Standard Committee will be accepted for material used in the construction of ships Engines and Boilers, same being carried out in the presence of a Bureau Veritas Surveyor.

§ 2. — All material which has satisfactorily withstood the Bureau Veritas tests and inspection is, to be legibly stamped with the mark .

The mark to be placed as far as possible from the ends of the plates or bars, so as to be visible on them when placed in the vessel.

The stamp should be at least one inch in size.

§ 3. — If the samples selected by the Surveyor for controlling the tests made by the manufacturer should be found inferior to the stipulated conditions, he is entitled to

condemn the whole quantity of the material belonging to the same lot. In this case the stamps **V** must be cancelled by the Surveyor with the mark RF (refused).

§ 4. — The Surveyor appointed for the special survey of the vessel, may, in doubtful cases, test any piece he may wish, notwithstanding that the prescribed tests have been performed. He will have the right to reject any material which may develop flaws before, during, or after its being worked into place.

It is well understood that the Bureau Veritas is not responsible for the quality of the material delivered to the shipyard.

#### ON THE USE OF MIXED MATERIALS IN THE CONSTRUCTION OF VESSELS.

§ 5. — It is recommended to use only one kind of material for the main structural parts of a vessel. But in vessels described in the Register by the letter A in column N° 12, the following parts may be of iron, viz : partition bulkheads, coal bunker divisions, engine and boiler seats and casings, tunnels, hatch coamings, deck houses and other non structural parts.

Forged iron may also be used in such vessels, for the following parts, viz : bar keels, stems, stern frames and rudder frames. These parts, whether of iron or steel, must have the dimensions required for iron.

Whenever iron is used for any structural part of a vessel, the latter will be described in the Register by the letters A. F. in the column N° 12. But in such cases it is recommended that the same material be used for all longitudinal parts, and the same for all transverse parts.

#### I. — MATERIALS FOR SHIP CONSTRUCTION.

§ 6. — The pieces offered for acceptance shall be taken by charges and the number of the charge must be stamped in a conspicuous manner on each piece.

A detailed list of the pieces submitted shall be handed to the Surveyor giving the name of builder and vessel for which the material is intended, also the number and date of order, the number and dimensions of the pieces, their weight and reference number and the number of the cast.

These data shall be entered by the Bureau Veritas Surveyor on the test sheets and on the certificate of acceptance.

A. — **Mild steel plates and rolled sections** intended for the construction of vessels with scantlings as given in the tables.

§ 7. — The tests shall include :

- 1° A tensile and elongation test.
- 2° A bending test after tempering (quenching test).
- 3° A cold bending test for plates.
- 4° A double bending test for flange sections.

## ARTICLE 33

### STEEL. — QUALITY AND TESTS

— 90 —

1° TENSILE AND ELONGATION TESTS. — Test pieces cut lengthwise or crosswise from the plates or bars must have a working length of 8 ins. and a finished breadth of  $1\frac{1}{4}$  ins. They must bear a tensile strength of from 27 to 32 tons per sq. in. of the original section with an elongation at rupture of at least 20 % in a length of 8 ins. For plates of  $\frac{1}{4}$  in. or less the elongation may be as per table at the end of this article.

2° QUENCHING TESTS. — Strips 2 inches wide, cut from the plates or bars, to be heated to a dull red and quenched in water at about 82° F., after which they must be able to stand, without any fracture, being doubled over and closed until the width of the opening near the bend is equal to three times the thickness of the sample.

3° COLD BENDING TESTS FOR PLATES. — Strips 2 inches wide, cut from the plates or bars must be able to withstand, without any fracture, being doubled over until the internal radius is equal to the thickness of the sample.

4° COLD BENDING TESTS FOR FLANGE SECTIONS. — A piece about  $1\frac{1}{2}$  ins. long cut from the bar, or, if preferred, one end of the bar to be opened out and flattened, and then bent over in a direction normal to the flanges until doubled up so that both ends touch. Under these tests, the bars must show no sign of fracture or cracks.

The number of tests to be made for each lot of steel

plates shall vary with the thickness as shown in the annexed table.

THICKNESS OF PLATE	ONE SET OF TESTS FOR EVERY
$\frac{4}{32}$	2 tons
$\frac{6}{32}$	3 »
$\frac{8}{32}$	4 »
$\frac{10}{32}$	5 »
$\frac{12}{32}$	6 »
$\frac{14}{32}$	7 »
$\frac{16}{32}$	8 »
$\frac{18}{32}$	9 »
$\frac{20}{32}$ & above	10 »

If the lot to be tested comprise plates of appreciably different thicknesses, the Surveyor will have the right to require the number of tests corresponding to the thinnest plate, or an average number.

For bars, one set of tests shall be made from each lot of 50 bars supplied.

When plates or bars are produced from different charges, at least one set of tests shall be made from each charge, in every case.

#### B. — STEEL RIVETS.

§ 8. — The series of tests shall include :

1° Tensile and elongation.

- 2° Cold bending.
- 3° Quenching test.
- 4° One cold crushing tests.
- 5° One hot crushing tests.

1° TENSILE AND ELONGATION TESTS. — Steel bars for rivets should have a tensile strength of from 24 to not exceeding 27 tons per sq. in. with a minimum elongation of 25 % in 8 inches. (20 % for rivets below  $\frac{13}{32}$  in. diar.)

For steel of less than 25 tons the spacing of the rivets shall be the same as for iron. (See Art. 27.)

2° COLD BENDING TESTS. — Pieces cut from rivet bars must be able to stand, without showing any fracture, being bent completely double the two inner edges being hammered flat against each other for the whole of their length.

3° QUENCHING TESTS. — Pieces cut from the rivet bars are to be heated to a dull red and quenched in water at about 82° F., after which they must be able to withstand, without showing any fracture, being bent completely double, the two inner edges being hammered flat against each other for the whole of their length.

4° COLD CRUSHING TESTS. — Short lengths equal to twice their diameter to be cut from the rivet bars and compressed cold to half their length, without showing any fracture.

5° HOT CRUSHINGS TESTS. — Other pieces of the same size, heated to a dull red, must stand being compressed to  $\frac{1}{4}$  of their length, after which they are to be punched through with a punch having a diameter equal to  $\frac{3}{4}$  that of the rivet. No cracks are to be developed under this treatment.

The number of tests to be made will be determined by the diameter of rivets as follows :

Diameter of Rivet in sixteenths.	One set of tests from every
4	4 Cwts.
5	6 »
6	8 »
8	10 $\frac{1}{2}$ »
10	14 »
12	19 »
14	24 »
16	30 »

#### C. — STEEL FORGINGS.

§ 9.—When steel forgings are to be used in engines and ships every piece must be efficiently annealed by heating to a uniform temperature and slow cooling and samples cut from the forging are to comply with the following tests :

- 1° Tensile and elongation.
- 2° Bending after tempering.

1° TENSILE AND ELONGATION TESTS. — The test pieces

## ARTICLE 33

### STEEL. — QUALITY AND TESTS.

— 92 —

shall be taken after the forging is annealed. They shall be turned to  $\frac{9}{16}$  in. diam. and have a working length of at least 4 inches.

The tensile strength may be from 27 to 32 tons per sq. in. of original section.

When the strength is 32 tons the elongation shall not be less than 23 % in a length of 4 ins. For less than 32 tons the elongation shall increase in inverse ratio to the strength ; thus, for 27 tons elongation shall be 26 %.

2° BENDING TESTS. — A test piece 1 in. square and about 10 ins. long, cut from the forging, is to be heated to a dull red and suddenly quenched in water at about 82 F. after which it must stand being bent double in the form of a U, without showing any sign of fracture or crack, the internal radius of bend being  $\frac{3}{4}$  ins.

NICKEL STEEL FORGINGS. — For nickel steel forgings the tests shall comprise :

1° Tensile and elongation.

2° Percussion.

(N. B. — The following tests for nickel steel forgings apply to steel having about 3.25 % nickel and 0.35 % of carbon. For steel of different composition the Administration will prescribe the tests to be made.)

1° TENSILE AND ELONGATION TESTS. — The test pieces to be prepared as above described, to be tempered and annealed,

and to have a tensile strength of from 37 to 42 tons per sq. in. with a minimum elongation of 20 % in a length of 4 ins.

2° DROP TESTS. — A test piece 1 in. sq. shall be placed horizontally on two knife edges,  $6\frac{1}{4}$  ins. apart, and at right angles to them. It shall resist without fracture fifteen blows by a weight of 40 lbs falling from a height of 9 feet.

The test pieces are to be cut cold from the forging and not to undergo any hammering or similar treatment beyond that which the forging itself has been subjected to.

When it is desired to make use of harder steel than the above, the case will have to be considered by the Administration.

NUMBER OF TESTS. — As to the number of tests, two will be sufficient for any number of forgings resulting from the same charge. When the number of the charge is not known to the Surveyor, more tests will be required.

For a large forging, such as a shaft, every piece of which it is composed is to be tested, the sample being taken, as far as possible, from the end where, when casting the ingot, the metal was run in.

### D. — STEEL CASTINGS.

§ 10. — All steel castings must be annealed.

For stems, stern frames, condensers engine columns, etc., the tensile strength may reach 35 tons per square inch of original section, or even 38 tons when a very fluid steel is required for thin pieces, such as sole plates.

For engine pieces exposed to constantly varying stresses the upper limit of tensile strength is to be lower than 35 tons. For crank shafts, for instance, it should not exceed 30 tons.

The series of tests required shall include :

- 1° A test for tensile strength and elongation.
- 2° A cold bending test.
- 3° A percussion test.
- 4° A drop test.

The test pieces shall be taken from the same charge as the casting either cast with it or in a separate mould.

For cast steel anchor heads only a bending test and drop test will be required.

1° TENSILE AND ELONGATION TESTS. — The test pieces for tension shall be turned to  $\frac{9}{16}$  in. diam. with a working length of 4 ins. They must have a strength of from 28 to 38 tons per sq. in. with an elongation at rupture of 16 % to 10 % in 4 ins. as per table at the end of this Article.

2° COLD BENDING TEST. — A test piece 1 in. square, must be able, without showing signs of fracture, to be bent to the angle given in the table, with an internal radius of  $1\frac{1}{2}$  ins.

3° PERCUSSION TESTS. — Pieces  $1\frac{1}{4}$  inch square, resting in a horizontal position on two knife-edge supports spaced  $6\frac{1}{4}$  inches apart must be able to stand without any fracture a series of shocks caused by a weight of 40 lb., falling upon them from a gradually increased height, beginning at  $3\frac{1}{3}$  feet and ending at 5 feet, the increase between two successive tests being 2 inches.

4° DROP TESTS. — The following drop test is to be applied to cast steel anchors.

The anchor to be placed at a height of about 12 ft. with its shank and arms horizontal and dropped on an iron or steel slab of sufficient strength to resist the shock without breaking. The slab to consist of a steel plate at least  $4'6'' \times 4'6'' \times 4''$ , supported by solid concrete, or masonry, at least 4 feet thick.

If this test gives a satisfactory result, the anchor is then to be placed with the crown downward at the same height above the ground as before and dropped on two iron or steel blocks in such a way that the middle of the arms strikes the edges of the blocks; the latter are to be sufficiently high to secure a clear space under the an-

## ARTICLE 33

### STEEL — QUALITY AND TESTS.

— 91 —

chor crown, preventing it from touching the ground.

The above tests for anchors refer only to the quality of the material. If it is desired to inscribe the mark AP in the Register, additional tests, the same as those required for iron anchors, will have to be applied.

Anchors cast of steel shall bear the mark *Steel Casting* in hollow letters cast in the metal.

Anchor rings or shackles, pins, bolts, forelocks or similar pieces, will not be accepted if made of steel cast in moulds.

Anchors must not be blacked or galvanized previous to being submitted to the above tests.

After having undergone the percussion or drop test to the Surveyor's satisfaction, the piece is to be hung up freely — as far as practicable — and hammered with a sledge hammer weighing at least 7 lb. for large castings such as rudders, stern frames, etc. Under this treatment it must emit a clear ring, convincing the Surveyor that the casting is sound.

### E. — STEEL WIRE ROPES.

§ 11. — Tests for galvanized steel wire ropes to be carried out as follows :

When the circumference does not exceed 5 inches, the

rope itself to be submitted to a breaking test as per Table N° 12<sup>2</sup>.

When the circumference is above 5 inches, the same test to be applied to one of the strands composing the rope, the aggregate resistance of which shall not be less than 5 % over that specified in the Table; — or to the wires composing the rope, the aggregate resistance of which shall not be less than 10 % over that specified in the Table.

Each of the galvanized wires shall in addition withstand the following tests :

1° To be twisted round itself as a core, not less than eight times, then untwisted and straightened without breaking.

2° A piece 8 inches long, cut from the wire to stand being twisted through the number of revolutions given by the following formula, without being cracked or split.

$$n D = 2$$

$n$  being the number of revolutions.

$D$  being the diameter of the wire in decimals of an inch.

**N. B.** The diameter of the reels for ceiling steel wire ropes to be not less than 18 times the diameter of the rope.

A. — PLATES AND BARS OF IRON INTENDED FOR  
SHIP CONSTRUCTION.

§ 12. — The series of tests shall comprise :

- 1° Tensile and elongation in the direction of the fibre.
- 2° Tensile and elongation across the fibre.
- 3° Hot bending test for plates.
- 4° Cold bending test for plates.
- 5° Forge tests for flange bars.

1° & 2° TENSILE AND ELONGATION TESTS. — The test pieces shall have a width of 1 1/4 ins. and a working length of 8 ins. They shall have a minimum tensile strength of 22 tons per sq. in. of the original section, with the fibre, and 18 1/2 tons across the fibre, with an elongation at rupture of 7 % with and 4 % across the fibre, in a length of 8 ins.

For the elongation of plates and rolled sections under 11/32 in. see Table.

3° HOT BENDING TESTS FOR PLATES. — A strip of at least 10 inches cut from the plate, after being heated to a dull red, shall stand, without any fracture or cracks, being bent to an angle of 140° with the fibre, and 90° across the fibre.

4° COLD BENDING TESTS FOR PLATES. — A strip of at least 10 inches cut from the plate, shall stand being bent to the following angles without any fracture or cracks :

Thickness of plate		Inside radius	With the fibre	Across the fibre
32nds	32nds	1 1/2 times the thickness of the plate	degrees.	degrees.
Under	8		90°	40°
8	to 11		70°	30°
11	— 16		50°	20°
16	— 21		35°	15°
21	— 25		25°	10°
25	— 29		20°	7°
29	— 31		15°	5°

5° FORGING TESTS FOR FLANGE BARS. — Pieces of angle bars being heated red, must stand the following tests without fracture or cracks :

- 1° To have their flanges shut until the outside edges touch.
- 2° To have their flanges flattened out.

NUMBER OF TESTS. — For iron plates and bars the number of tests to be made shall be the same as for steel plates and bars.

For iron pillars a special hot forge test should be made by drilling a hole through one of the bars at about 5 ins. from one end, and splitting the bar from the end

## ARTICLE 33

### IRON. — QUALITY AND TESTS.

— 96 —

up to the hole. The two branches thus formed are to be opened out and bent back so as to touch the bar. The material should exhibit no signs of fatigue under this test which is to be carried out in one heat.

#### B. — IRON RIVETS.

§ 13. — The tests shall comprise :

- 1° Tensile strength and elongation.
- 2° Cold bending test.
- 3° Hot bending test.
- 4° Punching test.

1° TENSILE AND ELONGATION TEST. — The minimum tensile strength shall be 19 tons per sq. in. with an elongation of 10 % in 8 ins.

2° COLD BENDING TEST. — The rivet bar shall be bent cold to a U form the distance between the legs being one fourth the diameter of the bar. It shall then be straightened out by hammering, and show no signs of fracture.

3° HOT BENDING TEST. — Pieces cut from the rivet bars and having a length of twice their diameter shall be compressed hot to one third their original length without showing any sign of fracture.

4° PUNCHING TEST. — A piece of rivet bar shall be hammered flat in the direction of the axis and be punched transversely by a punch having a diameter equal to that of the bar without showing any sign of fracture.

NUMBER OF TESTS. — The number of tests to be made shall be the same as for steel rivets.

#### C. — IRON FORGINGS.

§ 14. — All iron forgings must be carefully examined by the Surveyor.

When Veritas tests are required by contract for iron forgings, they will be applied as follows : samples taken from the forging must have a tensile strength of 22 tons with the fibre, with an elongation of 14 % at rupture.

ANCHORS AND CHAINS. — For vessels intended to be classed with the marks A. P., or A. & C. P. the anchors and chains shall be tested at one of the Proving Houses approved by the Administration as mentioned in Table N° 11<sup>1</sup> in the presence of one of the Society's Surveyors who will grant Certificates for same on the completion of the tests.

ANCHORS. — The tensile test for Anchors is given in Table N° 12<sup>1</sup> and is to be applied to the anchor through the ring and flukes.

• CHAINS. — Each length of 15 fathoms shall be subjected

to the tensile stress specified in Table N° 12<sup>1</sup>, after which each link shall be carefully examined, all defective ones cut out and renewed, and the length retested. A breaking test, also specified in Table N° 12<sup>1</sup>, shall be applied to a length of three links, cut from the cable.

## II. — MATERIALS FOR BOILERS.

### A. — MILD STEEL FOR PLATES, BARS AND STAYS.

§ 15. — The tests shall include :

- 1° Tensile and elongation.
- 2° Cold bending test.
- 3° Bending after tempering.
- 4° Forge tests for angle bars.

1° TENSILE AND ELONGATION TESTS. — The test pieces for tensile and elongation tests of plates and bars shall have a finished width of 1 1/4 ins. with a working length of 8 ins. and shall bear a stress of 22 to 30 tons per sq. in. of original section with an elongation of from 30 to 20 % (see Table at the end of this Article).

For plates one test piece to be cut longwise from one end of the plate, and another crosswise from the opposite end.

For stays the test pieces shall be turned down to a diameter of 9/16 in. with a working length of 4 ins.

and shall show a strength at rupture of from 22 to 30 tons per sq. in. of original section with a corresponding elongation of from 32 to 25 %.

2° COLD BENDING TEST. — Strips 2 ins. wide cut from plates or bars, or test pieces cut from round bars for stays are to be bent to the form of a U with parallel sides, the internal radius not exceeding the thickness of the test piece which under this test should exhibit no signs of fracture.

3° BENDING TEST AFTER TEMPERING. — A strip from 1 1/2 to 2 inches wide, cut from the plate and having its sharp edges taken off, heated to a dull red and then quenched in water at about 82° F., must not show any sign of fracture when bent double over a radius equal to 1 1/2 times the strip's thickness, the bending being continued until the two ends are parallel.

4° COLD BENDING TESTS FOR FLANGE SECTIONS. — A piece cut from the bar, or, if preferred, one end of the bar to be opened out and flattened, and then bent over until doubled up so that both ends touch. Under these tests, the bars must show no signs of fracture or crack.

NUMBER OF TESTS. — A complete set of tests will be required for each rolled plate also for all the stays and all the bars of a boiler.

N. B. — On condition that the elongation shall not be

## ARTICLE 33

### MATERIAL FOR BOILERS.

less than 20 %, steel of a higher tensile strength — but not exceeding 33 tons per sq. in. — may be used, with the sanction of the Administration.

The tensile strength of flanged plates and plates in contact with flame, however, should not exceed 26 to 30 tons per sq. in.

Plates that have been flanged or worked in the fire, especially when successive local heatings have been applied, must be annealed after the completion of the work.

Punching of steel plates is to be avoided. If punched, the plates are to be annealed after punching, unless the holes are rimmed or drilled out so as to remove the injured layer or ring round the hole, the thickness of this layer, measured along the radius being at least  $\frac{3}{32}$ nds of an inch.

#### B. — STEEL RIVETS.

§ 16. — Rivets for boilers shall satisfy the same conditions and undergo the same tests as those for ships.

#### C. — BOILER TUBES.

§ 17. — The material shall be of the best quality. The inside and outside surfaces must be perfectly plain,

— 98 —

without flaws, cracks, imperfect welding or any other defect; the thickness must be regular throughout.

The tests shall include :

- 1° Tensile and elongation.
- 2° Cold flattening.
- 3° Cold folding.
- 4° Cold expansion.
- 5° Cold flanging.
- 6° Internal hydraulic pressure.

1° TENSILE AND ELONGATION TESTS. — Strips cut from the finished tubes shall withstand a stress of from 22 to 25 tons with an elongation of 22 % in a length of 8 inches for tubes 0.08 in. thick and over, and of 20 % for thinner tubes.

2° COLD FLATTENING TEST. — A piece 4 ins. long to be flattened without fracture, the weld being situated in the folded part, until the distance between the sides be equal to the thickness, for tubes of or over  $\frac{6}{32}$ nds thick, and until the sides are close for thinner tubes.

3° COLD FOLDING TEST. — A piece 4. ins. long to be cut lengthwise at a reasonable distance from the weld, flattened cold, and rolled again in the opposite way, into a circle.

4° COLD EXPANSION TEST. — The end of the tube must admit of being expanded cold by a conical drift worked into it with a hammer, so as to increase the outside

diameter by 8 % for tubes of or over  $\frac{6}{32}$ nds thick, and by 10 % for thinner tubes.

5° COLD FLANGING TEST. — The end of the tube to be flanged at a right angle into a rim of four times the thickness for tubes under  $\frac{5}{32}$  thick, and of  $\frac{20}{32}$  for thicker tubes.

6° INTERNAL HYDRAULIC PRESSURE TEST. — All tubes to be submitted to an internal hydraulic pressure of at least 560 lbs per sq. in, and when under pressure, to be hammered with a light hammer, especially on the weld.

### MATERIAL FOR BOILERS. — IRON.

#### A. — PLATES AND ROLLED BARS.

§ 18. — The iron used in boiler construction is to be of the very best quality for which the tests shall be as follow :

- 1° Tensile and elongation with the fibre.
- 2° Tensile and elongation across the fibre.
- 3° Cold bending test.
- 4° Hot bending test.
- 5° Hot forge tests for angles.

1° & 2°. TENSILE AND ELONGATION TESTS. — The test pieces for tensile and elongation tests shall have a finished width of 1 1/4ins with a working length of 8ins. They shall have the following strength and elongation.

	SHELL PLATES		END PLATES		PLATES EXPOSED TO ACTION OF FIRE		Angle Bars
	With fibre	Across fibre	With fibre	Across	With fibre	Across	
Tensile strength tons per sq. in.	21	19	22	21	23	21½	23
Elongation % in 8 ins. . . . .	7	5	12	8	18	12	15

3° COLD BENDING TESTS. — Strips 1 in. in width to be bent over through the angles given in the following table without showing any signs of fracture :

THICKNESS OF PLATE IN 32NDS	SHELL		ENDS		PLATES EXPOSED TO ACTION OF FIRE	
	With fibre	Across	With fibre	Across	With fibre	Across
8-10	70°	45°	110°	90°	130°	110°

**COPPER AND BRASS.**

— 100 —

4° HOT BENDING TEST. — Strips 1 ins. in width, after being heated to a dull red shall be bent to the angles given herewith, without showing any sign of fracture or crack.

SHELL PLATES		END PLATES		PLATES EXPOSED TO FIRE	
With fibre	Across	With fibre	Across	With fibre	Across
150°	100°	180°	150°	180°	180°

5° FORGE TESTS. — Forge tests for angle bars to be the same as for ships.

**B. — RIVETS AND STAY BARS.**

§ 19. — The tests for iron boiler rivets shall be the same as prescribed for iron ship rivets except that the tensile strength shall be at least 23 tons per square inch with an elongation of 15 %. The same tests shall be applied to stay bars.

**C. — IRON TUBES.**

§ 20. — Iron tubes shall be tested under a hydraulic pressure of 560 lbs per sq. in. The material shall be of the best quality, as to which the Surveyor shall satisfy himself by suitable mechanical tests.

**COPPER AND BRASS.**

**A. — COPPER PLATES.**

§ 21. — The tests shall include :

1. Tensile and Elongation.
2. Cold Bending.
3. Hot Bending Test.
4. Dishing Test.

1° TENSILE TEST. — The Strips for the tensile and elongation test, shall have a finished width of 3/4 inch and a working length of 8 ins.

They must bear a tensile stress with the fibre, of 12 1/2 tons per square inch with an elongation of 22 %. These strips must not be annealed.

2° COLD BENDING TEST. — Strips 6 inches long and from 2 ins to 2 1/2 ins wide cut from the plates must be bent double with an internal radius not exceeding 1 1/2 times the thickness; without showing any sign of cracks.

3° HOT BENDING TEST. — Strips 6 ins long et 2 ins to 2 1/2 ins wide cut from the plates and heated to a dull red shall be bent double with faces touching and without showing any sign of cracking.

4° DISHING TEST. — A piece of plate shall be dished cold in the form of a spherical bowl and must show no sign of strain or cracking.

## B. — COPPER PIPES AND TUBES.

The copper used for making pipes and tubes must be perfectly pure and of the first quality.

The internal and external surfaces must be perfectly smooth without flaws, cracks, imperfect brazing or other defects; and the thickness must be uniform.

The tests shall include :

Tensile and Elongation Test.

Flanging Test.

Reversing Test.

Internal hydraulic pressure.

1° TENSILE TEST. — Test strips cut from a finished tubes and afterwards carefully flattened should bear a stress of 13 tons per square inch, with an elongation of 30 % in four inches. These strips are to be annealed before testing.

2° FLANGING TEST. — The tube shall be flanged outwards to a width equal to  $1/6$  the external diameter of the tube but not to exceed  $1\frac{1}{4}$  inch. This flange shall join the sides of the tube with a radius not greater than the thickness of the metal.

3° REVERSING TEST. — A piece of tube 4 inches long shall be cut of the tube, sawn through lengthwise, and bent back to form a cylinder, the former outer

surface becoming the inner one; after this it must not show any trace of strain or cracking.

4° INTERNAL HYDRAULIC PRESSURE. — All pipes and tubes must be submitted to an internal hydraulic pressure of 430 lbs per sq. in. without showing any sign of leaks or deformation.

## C. — BRASS TUBES.

The internal and external surfaces must be perfectly smooth, without flaws, cracks, imperfect brazing or other defects; and the thickness must be perfectly uniform.

The tests will include :

Flanging Test.

Expanding Test.

Flattening Test.

Internal hydraulic pressure test.

1° FLANGING TEST. — The tube shall be flanged outwards to a width equal to  $1/6$  the external diameter of the tube but not to exceed  $1\frac{1}{4}$  in.

The flange shall join the sides of the tube with a radius not exceeding the thickness of the metal.

2° EXPANDING TEST. — The tube shall be enlarged  $3/8$  inch by means of a drift, without showing any trace of strain or cracking.

3° FLATTENING TEST. — The tube shall be completely flattened.

4° INTERNAL PRESSURE TEST. — All tubes must be submitted for one minute to a pressure of 430 lbs per square inch, without showing any leak or sign of deformation.

NUMBER OF TESTS. — One set of tests shall be made for every 50 tubes.

The tubes used for making test pieces must be annealed for all mechanical tests.

#### IRON CASTINGS.

§ 22. — When iron castings are ordered to Bureau Veritas requirements, the following tests should be applied :

##### A. — CASTINGS FOR CYLINDERS, STEAM CHESTS, CONDENSERS AND BEARINGS.

The series of tests required shall include :

- 1° A tensile test.
- 2° A percussion test.

1° TENSILE TEST. — The test pieces for tension shall be turned to  $5/8$  in. diameter. They must have a minimum strength of 11 tons per sq. inch.

2° PERCUSSION TEST. — Pieces  $1\ 5/8$  in. square, resting in a horizontal position on two knife-edge supports spaced  $6\ 1/4$  inches apart, must be able to stand without any fracture a series of shocks caused by a weight of 27 lbs, falling upon them from a gradually increased height, beginning at 12 inches and ending at 18, the increase between two successive tests being 2 inches.

##### B. — CASTINGS FOR COLUMNS, BED PLATES, ETC.

The series of tests required shall include :

- 1° A tensile test.
- 2° A percussion test.

1° TENSILE TEST. — The test pieces as above must have a minimum strength of  $7\ 1/2$  tons per square inch.

2° PERCUSSION TEST. — The percussion tests to be made as above, and the gradually increased height to begin at 10 inches and to end at 16 inches.

## SURVEY OF MACHINERY AND BOILERS

## ARTICLE 34.

§ 1. — No class will be granted to vessels propelled by steam, or other mechanical means, unless the main and auxiliary machinery and boilers have been examined and certified, by an Engineer Surveyor of the Bureau Veritas, as satisfying the provisions of the present Article.

No mechanically propelled vessel will be entered in the Register with the Special Survey mark, unless the main and auxiliary machinery and boilers have been constructed under the special inspection of an Engineer Surveyor of the Bureau Veritas.

These provisions also apply to sailing vessels fitted with auxiliary boilers and machinery.

Machinery and boilers on board all vessels classed in the Register of the Bureau Veritas are subject to the periodical surveys specified in Art. 6.

All repairs and alterations to machinery or boilers must be carried out to the approval of the Engineer Surveyor, and reported by him to the Administration.

The Surveyors must be notified whenever the boiler, propeller, or tail-shaft of a vessel are removed; and in all cases when repairs of any importance are being made to the main or auxiliary machinery, or boilers.

When boilers have undergone important repairs, they are to be tested by hydraulic pressure to one and a half times the working pressure.

**ENGINES AND BOILERS BUILT UNDER  
SPECIAL SURVEY.**

§ 2. — To obtain the Special Survey of machinery and boilers, during construction, application should be made in writing to the Surveyor.

Plans of the boilers must be submitted in good time giving the working pressure, the heating and grate

surface, the volumes of steam and water spaces, and the minimum tensile strength of the materials employed for the various parts.

In addition, drawings of the safety valves are to be submitted.

All these plans must supply the data required for the calculation of the formulæ given in the present Article.

The Administration will return approved sunprints of the various plans submitted, on which will be marked such additions or alterations as may be deemed necessary.

All alterations to plans, officially approved, must receive the sanction of the Administration.

Duplicates of all orders for materials to be tested should be sent to the Surveyor of the district in which the machinery is being constructed.

The inspection of the Surveyor should continue during the whole period of construction, and should be made at different stages in the progress of the work.

In the course of these surveys the Surveyor must satisfy himself of the conformity of the work with the approved plans; as well as to the quality of the materials and workmanship; and that the requirements of the Rules have been observed.

Before any material is put into the work, the Sur-

veyor must verify the marks stamped by the Surveyor who passed it.

He may have any piece re-tested that he considers of doubtful quality, and may condemn any piece which he may find defective.

In examining the arrangement of details, in verifying the diameters of shafts, the thickness of shell and furnace plating, the riveting, staying, etc., and the allowed working pressure, the Surveyor will be guided by the following general instructions.

The engines and boilers must be fitted on board to his satisfaction, and particular attention paid to the fitting of the sea connections, and to the arrangement of all valves, cocks, and piping.

The cylinders of reciprocating engines, and the cast iron casings of steam turbines, are to be tested, in the presence, and to the satisfaction of the Surveyor, by hydraulic pressure, the amount of which, for cylinders, is to be calculated by the following rule — P being the working pressure in the boiler.

#### Double Expansion Engines.

H.P. Cylinder — Test pressure =  $P + 85$  lbs per sq. in.  
 L.P.    »    —    »        »        »        »        »        »

#### Triple Expansion Engines.

H.P. Cylinder — Test pressure =  $P + 85$  lbs per sq. in.  
 I.P.    »    —    »        »        »        »        »        »  
 L.P.    »    —    »        »        »        »        »        »

**Quadruple Expansion Engines.**

P.P. Cylinder	—	Test pressure	=	$P + 85$	lbs per sq. in.			
I.P. <sub>1</sub>	»	—	»	=	$P$	»	»	»
I.P. <sub>2</sub>	»	—	»	=	$0.5 P$	»	»	»
L.P.	»	—	»	=	$4\frac{1}{2}$	»	»	»

Condensers when finished to be tested, in the presence and to the satisfaction of the Surveyor, under a hydraulic pressure of 30 lbs per square inch.

For the cast iron casings of steam turbines, the hydraulic test pressure is to be calculated by the following rule —  $P$  being the working pressure in the boiler.

H.P. Turbine — Test pressure =  $P + 0.33 P$  lbs per sq. in.

L.P. Turbine (admission end)

Test pressure . . . . . =  $0.33 P$  » » »

L.P. Turbine (Exhaust end)

Test pressure . . . . . =  $30$  » » »

Astern Turbine — Test pressure =  $P$  » » »

These test to be made after the cylinders and turbine casings are machined.

In turbine casings they are to be made before the internal fittings are in place.

The Surveyor is to see that the boilers are so placed in the vessel that all manholes, sight-holes &c., are accessible for examination.

When the boilers are finished they are to be tested, at the works, in the presence and to the satisfaction of the Surveyor, under a hydraulic pressure equal to twice the working pressure.

Main steam pipes are to be tested to twice the boiler

pressure, and other steam pipes to twice the pressure in the spaces from which steam passes into them. The surveyor is to ascertain that pipes are so fitted as to provide for easy contraction and expansion.

But in countries where special regulations for the testing of boilers, cylinders, and condensers, are fixed by law, the Surveyors are authorised to conform to these requirements.

The Surveyor will inform the interested parties of any faults or defects he may observe during his inspection, and will indicate the necessary alterations without involving the responsibility of the Administration.

If the Surveyor's requirements be not complied with, the Administration reserves the right to refuse the classification of the vessel, or to grant her a lower class than that originally intimated.

The Surveyors shall be present at the trial of the vessel at sea after her completion; and report upon the efficient working of all machinery, pumps, steering gears, windlass, ground tackle &c.

When the machinery and boilers have been built under survey, the Surveyor will deliver a certificate to this effect and the machinery will be inscribed in the Register with the mark ✠.

All alterations and rearrangements of engines and boilers, also partial renewals in classed vessels must be made under Survey.

#### **SURVEY OF MACHINERY ALREADY BUILT.**

§ 3. — When application is made for the classification of steamers which have not been built under special survey, plans and specifications of the machinery and boilers should, when obtainable, be submitted by the Surveyor for the approval of the Administration.

If the machinery be in course of construction when application for classification is made, the Surveyor shall supervise the work until its completion, applying thereto the provisions of § 2 of the present Article.

If machinery and boilers are already constructed, they must undergo the complete survey and tests specified in § 5 of this Article.

The Surveyor will report to the Administration, as fully as possible, on the workmanship, condition, and working, of the main and auxiliary machinery, and boilers.

The Administration may require that this survey be made by two Surveyors of the Bureau Veritas.

By authority of the Administration, the Surveyor will deliver to the interested parties, the classification

certificate of the machinery and boilers, and the classification will be published in the Register and Supplements.

#### **MAINTENANCE OF CLASS. ANNUAL AND PERIODICAL SURVEYS. ANNUAL SURVEYS.**

§ 4. — Machinery and boilers should be surveyed every year, or as near that time as possible. The Surveyor will examine them generally, and may require such opening up of engines and boilers, and if necessary, such drilling of plates, as will satisfy him that they are in a good state of preservation and repair.

The Surveyor should be notified of all opening up, whether complete or partial.

Auxiliary machinery and boilers fitted on board sailing vessels, should also be Surveyed every year or as near that time as possible.

On the completion of the annual Survey the Surveyor will forward a detailed report to the Administration.

The annual Survey will be recorded on the classification certificate and published in the Register and Supplements.

#### **PERIODICAL SURVEYS.**

§ 5. — In order to be maintained in the class assigned, the machinery and boilers of vessels must undergo a complete Survey at the periods prescribed by Art. 1, § 5.

## ARTICLE 34

### SURVEY OF MACHINERY AND BOILERS.

— 112 —

The Surveyor must examine the following parts in order to ascertain that they are in good working order: the cylinders, pistons, and valves; the condenser, the air, circulating, bilge, and feed pumps; the main bearings, crank pins, tunnel shafting, propeller shaft, propeller fixing, and the stern bushes. When the vessel is in dry dock, all the sea connections are also to be carefully examined.

The propeller shaft is to be examined every two years; but due consideration will be given to exceptional cases if specially requested by owners.

The Surveyor will examine the general arrangement of the valves, cocks, and piping, and satisfy himself that the requirements of the Rules are carried out, and especially that the donkey steam pump can efficiently pump from the bottom of all compartments (see Art. 23, §§ 8 and 10, and Art. 34, § 10). The prescription of § 10 hereafter, with regard to the possibility of running sea water into the vessel, accidentally, or otherwise, be not overlooked, viz: That when there is a bilge suction valve connected with the circulating pump, it be fitted as non-return valve.

Boilers and superheaters are to be carefully examined inside and out, and the Surveyor must see that the load on the safety valves is in accordance with the

thickness of the plating, the system of riveting and the general condition of the boilers.

The Surveyor will attend to the machinery under steam.

Boilers must undergo a hydraulic test, equal to one and a half times the working pressure, every four years until twelve years old; after which they must be surveyed in accordance with this article, and tested as above, every two years.

The same test is to be applied whenever boilers or superheaters have undergone important repairs.

All parts of machinery and boilers, funnels &c., worn out to less than 75 % of their original thickness or sectional area, must be taken out and renewed: but this does not apply to shafts, which are to be renewed whenever the Surveyor considers it necessary.

On the completion of the periodical surveys the Surveyor will forward a detailed report to the Administration.

These surveys will be recorded on the certificate, and published in the Register and Supplements.

The survey may be held before the periods prescribed above.

**DAMAGE SURVEY**

§ 6. — A survey is to be held in all cases of accident to the engines or boilers of steam vessels classed in the Register.

The master must notify the Surveyor in case of damage; when this is not attended to, the class is liable to be withdrawn.

The Surveyor will examine all damaged or defective parts and fittings and will intimate to the interested parties what repairs are necessary in the interest of safety and for the maintenance of the class.

The Surveyor should be called to survey the repairs. He must in all cases examine the work when completed and forward a report thereon to the Administration.

## CONSTRUCTION AND ARRANGEMENT OF ENGINES AND BOILERS

## ENGINES.

## SHAFTS FOR SCREW STEAMERS.

## A. CRANK SHAFTS.

§ 7. When the crank of a screw engine is not overhung, the diameter of the shaft shall be determined by one of the following formulæ :

For non-compound condensing engines :

$$d = \sqrt[3]{\frac{n P L D^2}{C}} \quad \dots \quad (A)$$

For double, triple and quadruple expansion engines :

$$d = \sqrt[3]{\frac{P L (n_1 D_1^2 + 0.1 n D^2)}{C}} \quad \dots \quad (B)$$

For shafts having a single overhung crank, the form under the radical sign is to be multiplied by

$$s + \sqrt{s^2 + 1}$$

For two cylinder single crank tandem engines the formula will therefore be :

$$d = \sqrt[3]{\frac{P L (D_1^2 + 0.1 D^2) (s + \sqrt{s^2 + 1})}{C}} \quad (C)$$

In those formulæ :

$d$  = diameter of the after shaft bearing in inches.

$n_1$  = number of high pressure cylinders.

$D_1$  = diameter of each high pressure cylinder, in inches. — If there are several high pressure cylinders the diameters of which are not the same,  $n_1 D_1^2$  represents the sum of the squares of their respective diameters.

$n$  = number of low pressure cylinders.

$D$  = diameter of each low pressure cylinder in inches. If there are several low pressure cylinders the diameters of which are not the same,  $n D^2$  represents the sum of the squares of their respective diameters.

*N. B.* For triple or quadruple expansion engines the intermediate cylinders do not come into account in the formulæ.

$L$  = length of stroke, in inches, common to all pistons.

$P$  = boiler pressure above atmosphere, in pounds per square inch.

$s = \frac{a}{r}$  (see below). In order to determine  $a$ ,  $B$  is supposed

to be situated halfway the length of the bearing, unless the latter be longer than  $1 \frac{1}{2}$  times the diameter; in this case  $B C$  may be considered as being equal to  $\frac{3}{4}$  of the diameter.

$C$  = a constant, the values of which are given below for certain cases.

If it is above 15 ins it should be increased by an amount to be determined by the Administration; for built-up shafts, however, this latter increase will not be required.

For hollow shafts, the diameter must be increased by 1 % if the diameter of the hole is 0.4 of the outside diameter;

2 »	»	»	0.5	»
5 »	»	»	0.6	»
10 »	»	»	0.7	»

If the hole is under 0.4 of the outside diameter, no increase will be required.

The Administration may allow a reduction on the diameter in certain special cases, for instance in well balanced engines with light moving parts or for very superior workmanship, &c. On the other hand, the Administration may require an augmentation for engines which differ much from the average proportions found in practice, thus for instance for engines having a comparatively small stroke; for compound engines, the low pressure cylinder of which has a very large size, compared with the high pressure cylinder, &c.

VALUES OF C IN FORMULÆ (A), (B), (C).

**I. — Non-Compound condensing Engines with 2 cylinders and 2 cranks.**

Formula (A) where  $n=1$  and  $C=6230$  when the angle

between the cranks is  $90^\circ$ . When it is not  $90^\circ$ , the constants are to be multiplied by the following coefficients :

For $100^\circ$	0.91
$120^\circ$	0.79
$140^\circ$	0.72
$160^\circ$ — $180^\circ$	0.70

**II. — Double expansion Engines (ordinary Compound).**

1° Two crank two cylinder intermediate receiver engines.

Formula (B) where  $n_1=n=1$

$C=3400$  when the angle between the cranks is  $90^\circ$ .

For other angles the constant is to be multiplied by the coefficients given in case I.

2° Two crank double tandem engines (2 high and 2 low pressure cylinders).

Formula (B) where  $n_1=n=2$

$C=3500$  when the angle between the cranks is  $90^\circ$ .

For other angles the constant is to be multiplied by the coefficients given in case I.

3° Three crank triple tandem engines (3 high and 3 low pressure cylinders).

Formula (B) where  $n_1 = n = 3$

$C = 3800$  when the cranks are at  $120^\circ$ .

4° Single crank tandem engines (1 high and 1 low pressure cylinder).

When the crank is *not* overhung:

Formula (B) where  $n_1 = n = 1$

$C = 2100$

When the crank *is* overhung:

Formula (C) where

$C = 3200$

These two values suppose a cut-off at 0.8 of the stroke in the high pressure cylinder. For later cut-offs the constant is to be increased.

5° Three crank three cylinder engines (1 high, 2 low pressure cylinders).

Formula (B) where  $n_1 = 1, n = 2$

$C = 3600$  when the cranks are at  $120^\circ$ .

### III. — Triple Expansion Engines

1° Three crank three cylinder engines (1 high, 1 intermediate, and 1 low pressure cylinder.)

Formula (B), where  $n_1 = 1, n = 1$

$C = 3900$  when the cranks are at  $120^\circ$ .

2° Two crank three cylinder engines (two of the cylinders placed tandem-wise).

Formula (B), where  $n_1 = n = 1$

$C = 3000$  when the cranks are at right angles.

3° Two crank four cylinder engines (two tandem engines, viz. two high pressure cylinders on the top of the intermediate and low pressure cylinders).

Formula (B), where  $n_1 = 2, n = 1$

$C = 3300$  when the cranks are at right angles.

### IV. — Other cases.

For quadruple expansion engines, as well as for other cases not included in the foregoing, the constant will be determined by the Administration.

N. B. For quadruple expansion double tandem engines, with two cranks at  $90^\circ$ , the value of  $C$  may be provisionally taken as 3100.

In the case of 4 cranks at right angles, the value of  $C$  may be taken at 4000

If the sequence of cylinders and the angles of the cranks are chosen so as to reduce the maximum torsional moment, the above value may be increased, but in no case shall exceed 4100. Each particular case to be submitted for approval.

**B. PROPELLER, TUNNEL AND THRUST SHAFTS.**

The diameter of propeller shaft must be  $(1.7 \frac{D}{d} - 15)$  per cent in excess of the diameter of the crank shaft calculated from one of the formulæ (A), (B) or (C); D being the diameter of the propeller in inches and  $d$  the diameter of crank shaft in inches. It is recommended to fit the propeller shaft in such a way that it cannot move endways, if for some reason or other it has been uncoupled from the rest of the shafting. Liners fitted on propellershafts to be tapered off at ends.

For tunnel shafts a reduction of 6 % on the diameter of the crank shaft will be allowed.

The diameter of thrust shaft at the bottom of the collars, both between and immediately beyond these latter, to be equal to that of the crank shaft, and tapered off at each end to the smaller diameter of the body of the shaft. The thrust of the screw propeller must be taken up by an efficient thrust block so as to prevent any fore and aft strain on the crank shaft.

**SHAFTS FOR PADDLE ENGINES.**

§ 8. — In side wheel steamers having double, triple or quadruple expansion engines, with an intermediate shaft each end of which carries an overhung crank pin, fitting loosely into an eye of the paddle shaft crank, the bearing

of the latter (see A of the following sketch) must have its diameter calculated from the formula :

$$d = \sqrt[3]{\frac{P L (n_1 D_1^2 + 0.1 n D^2)}{C} (s + \sqrt{s^2 + 1})} \quad (D)$$

where the letters have the same meaning as before (§ 7), except that  $a$ , for determining  $s = \frac{a}{r}$ , is to be measured as shown in the above sketch, the point B being the middle of the bearing.

For two cylinder Compound receiver engines with two cranks at 90°.

$C = 13000$  for navigation in smooth water.

$= 7100$  for coasting vessels.

$= 5700$  for sea-going vessels.

For triple expansion engines with three cylinders and three cranks at 120°.

## ARTICLE 34

### SHAFTS FOR TURBINE ENGINES

- C = 14900 for navigation in smooth water.  
= 8150 for coasting vessels.  
= 6540 for sea-going vessels.

The diameter of the outer bearing of the paddle shaft and of the intermediate shaft to be submitted to the Administration or the Surveyors for approval. The same applies to other cases not dealt with in this paragraph.

#### SHAFTS FOR TURBINE ENGINES.

§ 9. — In turbine engines, where I. H. P is the estimated power transmitted by each shaft,

$d$  = diameter of tunnel shafting } in  
 $d_1$  = diameter of propeller shaft } inches  
 $D$  = diameter of propeller  
 $R$  = number of revolutions per minute,  
 $d$  and  $d_1$  should be given by the following formulæ:

$$d = \sqrt[3]{\frac{70 \times \text{I. H. P}}{R}}$$
$$d_1 = d + \frac{D}{160}$$

and rotor shaft is to have a diameter at the smallest part at least 5 % greater than tunnel shafting.

#### GENERAL ARRANGEMENT.

§ 10. — ENGINE AND BOILER ROOMS. — The space in the engine and boiler rooms must be of such dimensions that the working and keeping in order of the machinery may be easily carried out.

— 118 —

So far as possible, means should be provided above the cylinders and in the tunnel, to facilitate the opening up of the cylinders and line shafting.

The prescriptions of Art. 22, § 5 for the ventilation of various parts of the vessel, apply specially to the engine and boiler rooms.

The machinery must be so fixed that no displacement is produced by the movements of the vessel.

The working parts of the machinery must be guarded by plates or rails. Hand-rails must be fixed to the sides of the engine room and tunnel. In the latter the water-service pipe may be used as a hand-rail.

TURNING GEAR. — All reciprocating engines indicating more than 500 horse power, must be provided with turning gear.

STARTING GEAR. — Reciprocating engines indicating more than 500 horse power should be fitted with steam reversing gear.

CONDENSERS. — Condensers are to be of strong construction, and fitted with manholes and handholes for easy examination and cleaning.

#### PIPES, COCKS AND VALVES.

Valve chests, cocks, and pipe connections must in all cases (excepting ash cocks, and cocks for

water to bearings) be so arranged, that water from the sea cannot accidentally be run into the ship.

All discharge valves must be fitted directly on the skin of the vessel, and be accessible from the engine room at all times; they should be placed above the deep load water line if possible, and be capable of being closed in harbour.

It is strongly recommended not to carry the pipes of the pumps through the coal bunkers, without their being efficiently protected. They should be easily accessible.

Bilge pumps and donkey engines to be capable of pumping direct from every compartment of the vessel, excepting fore and after peaks (See Art. 23<sup>A</sup>).

If there is no well in holds with a double bottom, the pumps must have a suction pipe in both wing gutters.

Besides the suctions leading to the common valve box, another pipe leading direct from the engine pumps to the bilges of the engine room will be required.

When the circulating pump is connected to a bilge suction, every care must be taken against the possibility of sea water running into the vessel accidentally. For that purpose, the suction pipe may be fitted with a three way cock or with a non-return valve, provision being made in the latter case for screwing it down on its seat.

— The said cocks or valves to be efficiently protected

against the intrusion of any solid body that might prevent their being tightly shut.

A firehose must be provided capable of discharging water on every part of the ship.

In vessels built for France, the piping is to be painted with the following conventional colours.

Steampipes : Red.

Exhaust pipes, and steam pipes of condensers and evaporators : Red and white in alternate bands 20 inches long.

Fire and wash deck pipes, and sea suction pipes : Black.

Sea discharge pipes : Black and white in alternate bands 20 inches long.

Bilge pipes	{	Suction : Light maroon.
		Discharge : Light maroon and white in alternate bands 20 inches long.

Fresh water suction pipes : Blue.

Fresh water discharge pipes : Blue and white in alternate bands 20 inches long.

Boiler blow-off pipes : Dark green.

Supply pipes for hydraulic machines : Violet.

Discharge pipes from hydraulic machines : Violet and white in alternate bands 20 inches long.

## ARTICLE 34

### RULES FOR BOILER SHELLS.

— 120 —

## BOILERS.

### RULES FOR WORKING PRESSURE OR THICKNESS OF PLATES AND FOR SIZES OF STAYS (\*).

**N.B.** — When a boiler design is submitted to the Administration for approval, it must state the lowest tensile strength of the steel for the various parts, as on it the calculations affecting these must be based. The shearing strength of the rivets must also be stated thereon. If builders have not stated the tensile strength of plates and shearing strength of rivets on submitted plans of steel boilers, it will be understood that the minimum tensile strength of all plates (including furnace), and stays will be 26 tons and that steel rivets, fulfilling the requirements as specified in article 33, will be used.

In every case, a copy of the specification of the material, with the name of the makers, must also be supplied to the Surveyor through whom the plans are submitted for approval.

#### CIRCULAR SHELLS AND STEAMHOLDERS WITH INTERNAL PRESSURE.

§ 11. — A riveted joint may fail through the tearing of the plate or buttstrap between the rivets, the shearing of all the rivets, or by a combination of the two. The following formulæ apply to these several cases. The plate thickness and the diameter of rivets to be applied to have the highest values which each formula would give separately.

#### I. — RUPTURE THROUGH PLATE.

The formulæ for working pressure and plate thickness are in this case :

(\*) **N.B.** — If a boiler is intended for a vessel belonging to a country where the law prescribes heavier scantlings than those required by the following paragraphs, the builders have of course to comply with the legal requirements.

$$\left. \begin{aligned} P &= \frac{\alpha 2R (t - 0.04)}{D} \\ t &= \frac{P D}{\alpha 2R} + 0.04 \text{ inch} \end{aligned} \right\} \text{ (I)}$$

where :

**P** = Allowed working pressure, above atmosphere, in pounds per square inch.

**D** = Greatest inside diameter of boiler shell, or steamholder, in inches.

**t** = Thickness of shell plates in inches.

**t - 0.04 inch** represents the thickness left after a reduction of 0.04 inch through corrosion.

**R** = The tensile stress, in pounds per square inch, which will be allowed in the plate. The value of **R** will be the breaking strength divided by 4 the latter figure representing the factor of safety for the plate after it has been corroded away by 0.04 inch.

If the actual breaking strength happens to be known by tests carried out to the Administration's satisfaction, it may be applied for finding **R**; but when, as usually, it is not known, the value of **R** will be :

For *Steel* : the 4th part of the lower limit of tensile strength chosen by the designer (see Art. 33 § 15, etc.) which in such a case is to be stated when a boiler design is submitted for approval.

For *Iron* : 11200 lbs per square inch, corresponding with a tensile strength of about 20 tons. A table annexed shows the values of 2 **R** for various tensile strengths.

**α** = Ratio of the resistance of the plate left between the holes, to that of the full plates. It will be determined from the following expression :

$$\alpha = \frac{p - d}{p}$$

where :

**p** = Pitch of rivets in outer row, in inches (See fig. 1 and 2, page 113).

$d$  = Diameter of rivet holes, in inches, either the real diameter or  $a$  corrected one, according to the following clauses :

1° When the rivet holes are drilled, or when, having been punched, they are afterwards drilled or rimmed out so that the injured metal around is completely removed, the real diameter may be taken.

2° When the holes are simply punched they will be considered as being  $\frac{1}{4}$  inch larger in diameter than as punched.

TABLE SHOWING THE VALUES OF  $2 R$ ,  
IN FORMULÆ (I) AND (IV), FOR VARIOUS TENSILE STRENGTHS  
OF THE MATERIAL.

TENSILE STRENGTH OF PLATES IN TONS PER SQ. IN.	VALUE OF $2 R$ .	TENSILE STRENGTH OF PLATES IN TONS PER SQ. IN.	VALUE OF $2 R$ .
32	35800	24 $\frac{1}{2}$	27400
31	34700	24	26900
30	33600	23 $\frac{1}{2}$	26300
29	32500	23	25800
28	31400	22 $\frac{1}{2}$	25200
27	30200	22	24600
26 $\frac{1}{2}$	29700	21 $\frac{1}{2}$	24100
26	29100	21	23500
25 $\frac{1}{2}$	28600	20 $\frac{1}{2}$	22900
25	28000	20	22400

## II. — RUPTURE THROUGH RIVETS.

In this case the following are the formulæ for finding the allowed working pressure or required rivet section :

$$\left. \begin{aligned} P &= \frac{2 A S}{D l} \dots \dots \dots \\ \text{and } A &= \frac{P D l}{2 S} \dots \dots \dots \end{aligned} \right\} \text{(II)}$$

where  $P$  and  $D$  have the same meaning as before, and

$l$  = the length, in inches, of the identical parts into which a riveted joint can be sub-divided. In most cases  $l$  is the pitch of the rivets in the outer rows (Fig. 1 and 2). In general it depends upon the system of joint adopted.

$S$  = The maximum shearing stress, in pounds per square inch which will be allowed on the rivets. It will be the 4th part of the actual shearing resistance of the material which should always be ascertained by tests, when possible. If the actual shearing resistance of the rivet bars is not known, it will be assumed to amount to 0.8 of their tensile strength, and the value of  $S$  will be one 5th part of the lower tensile limit adopted by the designer in accordance with Art. 33 § 15, etc. The upper tensile limit should not exceed 27 tons per sq. in.

$A$  = The total shearing surface, in square inches, of the rivets (that is twice the area of the rivet hole when a rivet is in double shear), with or without corrections according to the following rules :

1° The total area of the rivet hole, without any reduction, may be brought into account when the rivet holes are drilled in place after the plates are bent and the longitudinal and circumferential seams at least double riveted, the former by machine.

This clause also applies to the case where the holes, having been punched, are afterwards drilled out in place so as to correspond perfectly with each other.

2°  $\frac{15}{16}$ ths of the full area are to be taken when the joint is made as in the preceding case with the exception that the riveting is done by hand.

3°  $\frac{7}{8}$ ths of the full area are to be applied when the rivet holes are punched after the plates are bent and the longitudinal seams at least double riveted.

## III. — COMBINED RUPTURE THROUGH PLATE AND RIVETS.

This case is only to be examined when the outer row has a wider pitch than the inner ones.

The formula to be applied in this case is :

$$P = \frac{2 (B \times R + C \times S)}{D \times l} \dots \dots \dots \text{(III)}$$

where P, R, S, D and  $l$  have the same meaning as before (See fig. 1 and 2);

B = The sectional area, in square inches, of the plate on the portion  $l$  of the joint along the line of its supposed rupture, assuming that in case the plate is liable to corrosion its thickness has been reduced by 0.04 inch. The area of the plate is to be corrected as per Case I, No 2, when the rivet holes are simply punched.

C = The total area of the rivets which are supposed to shear on the length  $l$ , corrected, if required, in the same way as prescribed in Case II, Nos 2 and 3.

For a rivet in double shear the resistance will be considered as being twice that of one in single shear.

Fig. 1

#### IV. — RUPTURE THROUGH BUTTSTRAPS.

Rupture may take place along one of the inner rows of rivets (see P Q., Figs. 1 and 2). The formulæ for this case, based on the same principle as (I), are :

$$\left. \begin{aligned} P &= \frac{\alpha 2 R (t - 0.04)}{D} \dots \dots \dots \\ \text{and } t &= \frac{P \times D}{\alpha 2 R} + 0.04 \text{ inch} \dots \dots \end{aligned} \right\} \text{(IV)}$$

where P, D and R have the same meaning as before

Fig. 2

$t$  = Thickness, in inches, of butt strap, or sum of thicknesses if there are two straps. (The thickness of course not to be less than required for caulking).

$$\alpha = \frac{q-d}{q} \text{ where :}$$

$q$  = Pitch of rivets in the inner row, in inches.

$d$  = Diameter in inches of the rivet holes in the inner row, increased by  $\frac{1}{4}$ th of an inch if the holes are simply punched.

#### V.—COMBINED RUPTURE THROUGH BUTTSTRAPS AND RIVETS

Formula (III) applies to this case, B being the section of the buttstrap or straps along which rupture would take place.

Corrections as for Case III, Nos 2 and 3.

#### REMARKS.

No rivet holes to be nearer the edge of any plate than the diameter of the rivet.

In zigzag riveting the distance between the rows is to be such that no rupture through plate or buttstrap is to be feared along the zigzag line.

When stays are bolted through the shell, they should be so arranged that they do not weaken the shell plates more than the riveted joints. If the resistance at the stay bolts is the smaller of the two, the thickness of the plate shall be determined by it. It will be found from a formula the same as (I),  $p$  and  $d$  applying to the stay bolts.

EXAMPLE, SHOWING THE APPLICATION OF THE ABOVE RULES TO THE JOINT SHOWN IN FIG. 2 (page 113).

I. — The value of  $p-d$  is the clear distance between the rivet holes E and F.

If the holes are punched,  $p - (\text{dia. hole E} + \frac{1}{4} \text{ inch})$  is to be considered as the equivalent length.

II. — The length  $l$  is equal to  $p$ . The rivets which would be sheared on this length would be :

in single shear : one half of rivet E, one half of rivet F, total *one* rivet E.

in double shear : one half of rivets H and J, the whole of G and K. Total 3 rivets, each counting double.

Consequently :

$A$  = area of *one* hole E  $+ 6 \times$  area of *one* hole G.  $A$  is to be multiplied by  $\frac{15}{16}$  or  $\frac{7}{8}$ , in accordance with Case II, 2° and 3°, if the conditions mentioned therein take place.

III. — Rupture of plate along the line NO and shearing of the rivets in the outer row.

No corrosion is likely to take place in the interior of the joint. Consequently, in formula (III).

$B = (p - 1\frac{1}{2} \times \text{dia. of rivet hole G}) \times \text{plate thickness}$ ; the diameter of the rivet hole G being increased by  $\frac{1}{4}$  " if the holes are punched.

## ARTICLE 34

### RULES FOR BOILER SHELLS

— 124 —

The shearing surface of the rivets is one half of E and one half of F. Therefore

$C = \text{area of one rivet hole E, to be multiplied by } \frac{15}{16} \text{ or } \frac{7}{8}$   
if required according to clauses Nos 2 and 3, Case II.

#### IV. — Rupture of buttstraps through P Q.

The area which resists rupture is, on the length  $q$  :

$(q - \text{dia. of hole J}) \times \text{sum of thicknesses of straps, the diameter of J to be increased by } \frac{1}{4} \text{th inch if the holes are simply punched.}$

#### V. — Rupture of buttstrap through LM.

In this case the rivets in the rows NO and PQ must shear (double shear), and we have in formula (IV) :

$B = (p - \text{dia. of hole E}) \times \text{thickness of wide strap.}$

The diameter E being increased by  $\frac{1}{4}$  inch if the holes are simply punched.

$C = 3 \times \text{area of hole G} + 3 \times \text{area of hole K.}$

Which value has to be multiplied by  $\frac{7}{8}$  or  $\frac{151}{6}$  if the case II, Nos 2 and 3 occur.

#### SHELLS OF SUPERHEATERS.

The same mode of determining the working pressure or the thickness of shell plates will be followed for circular cylindrical superheaters, and the same formulæ may be used, but with the following alterations :

1° When the plates are exposed to the direct action of the products of combustion, the values of R and S as given for Cases I and II will have to be multiplied by

0.8 and the addition to the thickness of plates on account of corrosion will be increased from 0.04 to  $\frac{3}{16}$ ths of an inch to compensate for the corrosive action of the gases.

Formulae (I) become therefore :

$$P = \frac{\alpha \times 1.6 R (t - \frac{3}{16})}{D}$$

$$\text{and } t = \frac{P D}{\alpha \times 1.6 R} + \frac{3}{16} \text{ in.}$$

2° When the plates are protected from the direct action of the products of combustion, R and S will be multiplied by 0.9 and the additional thickness for burning away will be  $\frac{1}{8}$  inch.

Formulae (I) become in this case :

$$P = \frac{\alpha \times 1.8 R (t - \frac{1}{8})}{D}$$

$$\text{and } t = \frac{P D}{\alpha \times 1.8 R} + \frac{1}{8} \text{ in.}$$

#### FLAT PLATES.

§ 12. — The allowed working pressure or the thickness of flat plates is to be determined by the following formulæ :

$$P = \frac{(t - 1)^2}{a^2 + b^2} \times \frac{T}{C}$$

$$\text{and } t = 1 + \sqrt{\frac{P C}{(a^2 + b^2) T}}$$

where :

$P$  = Allowed working pressure above atmosphere, in pounds per square inch.

$t$  = Thickness of plate in sixteenths of an inch.

$a$  = Pitch of stays, in inches, in one row.

$b$  = Distance, in inches, between two rows of stays.

*Note.* — When plates are effectively stiffened by doubling plates well-riveted thereto, and having a thickness  $t$  in sixteenths; the value  $(t + \frac{1}{2} t)$  may be substituted for  $t$  in the formulæ.

In case of irregular staying, such as in the annexed sketch,

$$\frac{1}{4} (p_1 + p_2)^2$$

shall be taken instead of

$$(a^2 + b^2)$$

$T$  = Tensile strength of the material in tons per square inch of the original section.

It is to be determined in the same way as for shell plates, that is :

For *Steel* it will be equal to the lower limit of the tensile stress, which is to be stated on the drawing ;

For *Iron*, 21 tons per square inch.

$C$  = a constant, the value of which depends upon the mode of staying as follows :

$C = 0.084$  when plates are supported by stays screwed through them and riveted over.

$C = 0.065$  when plates are supported by stays screwed through them and fitted with outside nuts.

$C = 0.062$  when there are nuts on both sides of plate & the outer nut has under it a washer whose diameter is not less than 0.4 of the distance between rows of stays with thickness not less than  $\frac{2}{3}$  that of the plate.

$C = 0.055$  when the outside washers as above have a diameter at least 0.6 of the distance between rows of stays with a thickness not less than  $\frac{3}{4}$  that of plate, the washers being well riveted to the plate.

$C = 0.050$  when outside washers are replaced by continuous strips of plate having a width of at least 0.6 of the distance between the rows of stays, with a thickness not less than  $\frac{3}{4}$  that of the plate; the strips being well riveted to the plate.

For the values of  $\frac{T}{C}$ , see following Table.

When the plates are in contact with steam on one side and flame or hot gases on the other, the thickness is to be increased. For instance, when in return tube boilers, the top front plates are in no way protected from the hot gases, the working pressure or thickness will, in such a case, be determined by the formulæ :

$$P = \frac{(t - 2)^2}{a^2 + b^2} \times 0.9 \frac{T}{C}$$

$$\text{and } t = 2 + \sqrt{\frac{(a^2 + b^2) P C}{0.9 T}}$$

When the said front plates are protected by a flame plate, no increase of thickness will be required.

When front plates are in two pieces, the lap should be double rivetted if the thicker plate is  $\frac{1}{2}$  in. or above.

VALUES OF  $\frac{T}{C}$  IN THE FORMULA FOR FLAT PLATES.

TENSILE STRENGTH OF PLATE IN TONS PER SQUARE INCH	C = 0.084	C = 0.065	C = 0.062	C = 0.055	C = 0.050
20	$\frac{T}{C}=238.0$	$\frac{T}{C}=307.6$	$\frac{T}{C}=322.6$	$\frac{T}{C}=363.6$	$\frac{T}{C}=400$
21	250.0	323.0	338.6	381.8	420
22	262.0	338.4	354.8	400.0	440
23	273.8	353.8	371.0	418.0	460
24	285.8	369.2	387.0	436.2	480
25	297.6	384.6	403.2	454.4	500
26	309.6	400.0	419.4	472.6	520
27	321.4	415.3	435.4	490.8	540
28	335.4	430.7	451.6	509.0	560
29	345.2	446.1	467.8	527.2	580
30	357.2	461.5	483.8	545.4	600

## STAYS.

§ 13. The diameter of stays supporting flat surfaces is to be determined by the following formula :

$$d = \frac{1}{8} \text{ inch} + \sqrt{\frac{Q}{300 T}}$$

where :

$d$  = Effective diameter in inches (for instance the diameter at bottom of thread in screw stays).

$Q$  = Total load on stay in pounds.

$T$  = Tensile strength of the material, in tons per square inch.

For steel this tensile strength will be the lower limit chosen by the boiler designer, in accordance with Art. 33 § 15; for iron it will be taken at 22 tons. — In both cases the actual strength may be applied if it is known from tests.

If the stays are not round, their cross section must be such that the stress per square inch, caused by the load  $Q$ , nowhere exceeds one 5.75th part of the tensile strength, after deducting 1/16th of an inch all round as an allowance for corrosion or wear.

In welded stays the stress as just described will be reduced by 20 %. Welding of steel stays is only allowed for very mild qualities.

For high working pressures, such as used in triple expansion engines, it is recommended to screw all stays into the plates they support, in addition to fitting them with nuts.

This also applies to stay tubes, with the exception that it is recommended that nuts should not be fitted in combustion chambers.

## CIRCULAR FURNACES.

## PLAIN CYLINDRICAL FURNACES.

§ 14. — When plain furnaces are made as truly circular as practicable, and of steel having a tensile

strength of not less than 26 tons per sq. in., the working pressure  $P$  and thickness of plate  $T$  may be calculated by the following formulæ :

$$P = \frac{16000 T - 60 L}{D}$$

$$T = \frac{P \times D + 60 L}{16000}$$

where :

$T$  = Thickness of plate in inches.  
 $P$  = Working pressure in lbs per sq. inch.  
 $D$  = External diameter in inches.  
 $L$  = Length in inches.

*N. B.* — When the furnace is in one length  $L$  is measured from the centre of rivets at furnace mouth to those connecting back end to the tube plate; or to the commencement of flanging where back end of furnace is flanged. When the furnace is divided into two or more parts by Adamson joints  $L$  is measured to the centre of joint.

For iron or low tensile steel the constant  $C$  to be reduced to 14400.

Furnace plates should not exceed 13/16" in thickness.

When iron is employed, the material must stand the following tests :

	With the grain.	Across the grain.
Tensile strength. . . . .	23 tons p. sq. in.	21 1/2 tons p. sq. in.
Elongation in 8 inches. . . .	16 %	10 %
Cold bending without fracture to an angle of. 60°		35°
Hot . . . d° . . . d° . . . d° . . . 180°		180°

#### VERTICAL BOILERS.

§ 15. — When the dished ends are portions of sphere

in vertical boilers, steam chests or otherwise, their thickness must not be less than :

$$\alpha t = \frac{Pr}{840} + 2$$

where :

$t$  = thickness of the plate in sixteenths of an inch;  
 $\alpha$  = percentage of joint;  
 $P$  = working pressure in lbs per sq. inch;  
 $r$  = radius of curvature in inches.

When the end is made is one plate,  $\alpha = 1$ .

When the tops of furnaces are portions of spheres the thickness must not be less than :

$$\alpha t = \frac{Pr}{600} + 3$$

where :

$\alpha, t, P, r$  have the same meaning as before.

#### CORRUGATED AND RIBBED FURNACES.

§ 16. — The plate thickness is to be found by the following formulæ :

1° For corrugated furnaces :

$$T = \frac{PD}{1259} + 2$$

where :

$P$  = Working pressure in lbs per square inch.  
 $T$  = Thickness of plate in sixteenths of an inch.  
 $D$  = Outside diameter in inches measured on the top of the corrugations.

The formula applies to corrugations 6 inches long and 1 1/2 inch deep.

2° For ribbed furnaces, when manufactured to the satisfaction of the Administration :

$$T = \frac{PD}{1160} + 2$$

where P and T are as above.

D = Greatest outside diameter between the ribs, in inches.

The formula applies to ribs spaced 9 inches and projecting  $1\frac{3}{8}$  inch, the difference between the greatest and the smallest diameter in any part of the furnace not exceeding  $\frac{3}{1000}$

3° For bulb furnaces :

$$T = \frac{PD}{1259} + 2$$

where D is the outside diameter in inches measured between the bulb.

The coefficients in the above formulae apply to the case where the tensile strength of the material is 26 to 30 tons per sq. in. When it is below 26 tons, the coefficient is to be reduced by  $\frac{1}{26^{\text{th}}}$  for each ton below 26.

#### COMBUSTION CHAMBER GIRDERS.

§ 17. — The strength of girders on the tops of combustion chambers shall be determined as follows :

$$D = \frac{CpL}{(W - p) DL}$$

C = working pressure.

p = a constant found as under.

d = depth of girder.

t = thickness of girder.

L = length of girder between supports.

W = width of fire box from tube plate to back plate.

} in  
} inches.

N = number of bolts in each girder.

p = pitch of bolts in inches.

D = distance between girders, centre to centre, in inches.

(1) For iron girders :

$$C = \frac{12000 N}{N + 1} \text{ for odd numbers of bolts.}$$

$$C = \frac{12000 (N + 1)}{N + 2} \text{ for even numbers.}$$

(2) For steel girders :

C as formed above may be increased 10 %.

#### GENERAL AS TO BOILER ARRANGEMENTS AND FITTINGS.

§ 18. — BOILER ROOM. — Boiler rooms shall be of dimensions sufficient to admit of easy stoking and management of boilers.

Every boiler room shall have at least two exits easily accessible.

To prevent the boilers shifting in a transverse direction through the rolling of the vessel, or longitudinally in case of collision, they must be properly secured in their seats.

All manholes to be fitted with compensating rings.

SAFETY VALVES. — At least two spring safety valves, of an approved design must be fitted to each main boiler, and be conveniently accessible.

Only one safety valve will be required in boilers having a grate surface not exceeding 5 square feet.

When feed heaters are arranged in such a manner that they may be shut off from the boilers, they shall be fitted with a safety valve set so as to blow off, in any case, at a pressure 10 % above the working pressure of the boiler.

The same will apply to superheaters, unless arranged in such a way as to prevent the pressure in same from exceeding the working pressure of the boiler.

The total area of the safety valves is given by following formula :

$$A = \frac{8.7}{\sqrt[4]{(P-18)^3}}$$

where

A is the sectional area of the safety valve in square inches per square foot of the grate surface.

P = the working pressure of the boiler in pounds per square inches.

Nevertheless, no safety valve to be less in diameter than 1 1/4 ".

When forced draught is provided for, the area is to be increased in proportion to the increased evaporative power of the boilers.

Suitable arrangements and gear to be fitted in connection with the safety valves whereby they may be lifted from the deck as well as from the stoke-hole floor.

FEED PUMPS. — Each boiler shall have two separate feeds suitably arranged, each sufficient for feeding the boiler in all circumstances, and one of them, at least, to be independent of the main engines.

Only one feed will be required for boilers fitted on board sailing vessels, pontoons, dredgers, barges, and the like, also for donkey boilers in steamers.

A check valve, working automatically, is to be fitted to the boiler at the delivery of each feed pipe. When boilers are arranged to be worked, together, each must have its own feed pipes and check valves.

STOP VALVES. — Every steam pipe, for main or auxiliary engines, must be fitted with a stop valve, or cock, where it joins the boiler, fixed on the boiler itself. The stop valve for the main engines should be capable of being worked from the upper deck.

When two or more boilers are fitted, they should be arranged to work separately or independently of each other, either by stop valves between the boilers and the common superheater, or by stop valves between the separate superheaters and the main steam pipes.

BLOW-OFF VALVES. — Surface and bottom blow-off cocks or valves are to be fitted to each cylindrical boiler, and fixed directly on the shell.

In water-tube boilers a single blow-off cock only will be required.

In addition to the above, blow-off pipes must be fitted with cocks attached directly to the shell of the vessel.

Arrangements should be made to ensure that the opening and closing of blow-off cocks can be properly regulated.

When a single blow-off pipe is connected to several boilers, it must be fitted with cocks or valves preventing the passage of water from one boiler to another.

To protect the plating, the cocks on the ship's bottom should be fitted with spigots passing through the plating, and through a flange on the outside. If this flange is of iron it must be galvanized.

PRESSURE GANGES. — Every boiler must be supplied with a pressure gange in good condition, placed in view of the firemen and graduated to show the working pressure of the steam in the boiler. This gange must be properly lighted at all times.

A distinct line should be marked on the scale of the pressure gange to indicate the working pressure which must not be exceeded.

Each pressure gange must be fitted with a cock for shutting it off from the boiler.

Double-ended boilers must have a pressure gange at each end.

When the stokehold is not close to the engine room and in free communication therewith, pressure ganges connected to each boiler are to be fitted in the engine room.

Each boiler should be furnished with a fitting terminating in a flange 1 1/2 inch diameter and 1/4 inch thick, for attaching a standard gange.

Every receiver or steam vessel for which a safety valve is prescribed by § 19 above, should be fitted with a pressure gauge.

CONNECTION FOR HYDRAULIC TEST. — A suitable connection is to be provided at the top of each boiler for making the hydraulic test, except when there is a man-hole plug, specially fitted for this purpose.

Every boiler must be provided with manholes, mudholes and sight holes conveniently arranged for inspection and cleaning. Cast iron must not be employed for the doors closing any of these holes.

Boilers which are too small to permit of entrance for inspection, must have a sufficient number of cleaning holes suitably arranged to allow of examination from the outside.

§ 19. — Propelling machinery other than steam engines.

In the survey of propelling or auxiliary machinery other than steam engines, the Surveyors of the Bureau

Veritas will conform to the special prescriptions published separately by the Administration, and especially to the Rules for Motor Boats.

---

## EQUIPMENT AND SPARE GEAR

## ARTICLE 35

## EQUIPMENT

All vessels shall be equipped as follows :

§ 1. — SAILS, RIGGING. — All vessels, sail or steam, shall have one complete suit of sails, with all rigging and gear necessary for same.

§ 2. — ANCHORS, CABLES, TOWLINES AND HAWSERS. — All vessels to be furnished with anchors, cables, towline, and hawsers as required by Tables N° 11.

The weight of anchors, the diameter of chain cables, and the circumference of hawsers, will be determined by the numerals given in Tables N° 11, the depth being measured to the upper deck, except in awningdeck vessels, where the depth may be measured to the second deck. To these numerals must be added half the capacity

in cubic feet of the raised decks, awningdecks and deck erections such as poops, bridgehouses or forecastles.

A reduction of one-third will be allowed on the numeral determining the weight of the anchors and the diameter and length of chain cables of full-powered steamers.

If **stockless anchors** are used, the weight calculated as above, is to be increased by about 25 % to make up for the weight of stock and the weight of the shank should not be more than 1/3 of the total weight.

§ 3. — Vessels supplied with ANCHORS OR CHAIN CABLES which have been submitted to Veritas proofs at a testing machine recognized by the Administration and in the presence of Veritas surveyors, will be inserted in the Register with the following marks:

A. P. for Anchors.

C. P. for Chains.

A. & C.P. for Anchors and Chains.

All vessels built under special survey must have their anchors, chain cables and wire hawsers tested as above stated. (See also Art. 3, § 1.) If tested anchors or chains be replaced by anchors or chains which have not been tested the marks A. & C. P. will be withdrawn until the tests have been made.

§ 4. PUMPS. — All vessels to be fitted with pumps as required by Art. 23<sup>A</sup>.

§ 5. — WINDLASS AND WINCHES. — Windlass and winches to be fitted in accordance with Art. 29.

§ 6. — BOATS. — All vessels to have a boat fit to carry a stream anchor. Vessels under 100 tons gross register to have one boat; vessels over 100 tons and under 400 tons, to have two boats; and vessels above this tonnage to have at least three boats, according to the size of the vessel, and as may be required by law. Such of the latter as may be required by law, to be fitted as life-boats.

All boats to be completely fitted out.

§ 7. — Surveyors are authorised to conform to special national laws which may exist with reference to boats and outfit not detailed in this Article.

#### SPARE GEAR

§ 8. — All vessels shall be provided with the following spare gear :

A spare tiller or quadrant with fittings, ready to be put in place.

Relieving tackle for tiller

One set of joining shackles for steering chains.

Two joining shackles for chain cables.

One joining shackle for each anchor.

Lights, compasses, charts, and nautical instruments as may be required by existing national laws.

These instruments must be in perfect working order.

#### SPARE GEAR FOR ENGINES.

§ 9. — The following articles of Spare Gear are required or recommended for all steamers classed with the Bureau Veritas.

Vessels which carry the recommended, as well as the required spare-gear will be entered in the Register with a special mark ( ) in the third column of the page where particulars of machinery are described.

§ 10. **For navigation Marks P. R. or Lakes.** — The following articles are required :

1 bolt and nut complete for piston-rod, or top end of connecting rod.

1 bolt and nut complete for bottom end of connecting rod.

1 bolt and nut complete for main bearings.  
 1 set of shaft coupling bolts and nuts (for one coupling).  
 1/2 set of feed pump valves.  
 1/2 set of bilge pump valves.  
 1/2 set of pistod rings.  
 1/2 set of safety-valve springs.  
 One canvas fire hose.  
 One set of spanners.  
 Plugs for boiler tubes.  
 6 gange glasses.  
 1 steam gauge.  
 The following articles are recommended :  
 1/2 set of circulating pump valves.  
 1/2 set of air-pump valves.  
 1/2 set of feed check valves for boiler.  
 1 slide-valve rod suitable for each cylinder.  
 1 valve motion sliding block.  
 1 eccentric strap or liner for same.

§ 11. **For Navigation Marks M. G. or L.** — ARTICLES REQUIRED :

2 bolts and nuts complete, for piston rod or top end of connecting rod.  
 2 bolts and nuts complete, for bottom end of connecting rod.

2 bolts and nuts for main bearings.  
 1 set shaft couplings bots (for 1 coupling).  
 1/2 set feed pump valves.  
 1/2 set bilge pump valves.  
 1 set of piston rings.  
 1 set of safety-valve springs.  
 5 % of the total number of boiler tubes.  
 4 % of the total number of condenser tubes.  
 1/2 set of fire bars.  
 One canvas fire hose.  
 One set of spanners.  
 Plugs for boiler tubes.  
 12 gauge glasses.  
 1 steam gauge.

Articles recommended :

1 propeller ; or, when detachable blades are fitted,  
 1/2 set of blades for each line of shafting.

Spare propellers must be secured on deck by angle lugs riveted through the deck and beams, or other efficient means.

1 crank shaft ; or, if in several interchange pieces, 1 piece for each line of shafting.  
 1 propeller shaft.  
 1 slide-valve rod suitable for any cylinder.  
 1 valve motion sliding block.

1 Eccentric strap, or liner for same.

1 pair crank-pin brasses.

1 pair crosshead brasses.

If fitted with white metal, then sufficient metal and tools for applying same, in each case.

1 air pump rod.

1 circulating pump rod, or when a rotary circulating pump is fitted, driven by an engine, then, instead of this rod :

1 steam piston and rod for each cylinder.

1 slide valve for each cylinder.

1 set brasses (for crosshead and crank pin).

10 % of piston junk-ring bolts.

10 % of cylinder cover bolts.

10 % of valve chest cover bolts.

1 set air pump valves.

1 set circulating pump valves.

1/2 set boiler feed check valves.

1 set of safety valve springs (Main boiler).

1 set of safety valve springs (Donkey boiler).

1 piston for each cylinder, complete.

1 cover for each cylinder, complete.

1 sternbush, or lignum vitae strips for same.

#### SPARE SAILS FOR SAILING VESSELS.

§ 12. — 1° For fore-and-aft rigged coasting vessels : One foretopmast staysail, One trysail.

2° Square-rigged coasting vessels : One foretopmast staysail, one foresail and one trysail.

3° Fore-and-aft rigged vessels (classed A or L). One jib, One foretopmast staysail, One trysail.

4° Square-rigged vessels. **Atlantic** : One jib, and One foretopmast staysail, Two topsails, One foresail, One topgallantsail. **Long voyages** : One mainsail in addition to the foregoing.

Sail cloth in sufficient quantity to make, with the spare sails enumerated above, a complete suit of sails.

For vessels having more than two masts square-rigged, there should be in addition to the above, another spare main sail, and spare topsails.

#### SPARE SPARS FOR SAILING VESSELS.

§ 13. — 1° For vessels classed A : One spar suitable for a topmast or lower yard, and one spar for a topgallant yard.

2° For vessels classed L : In addition to the above, one spar suitable for a topmast or topsail yard.

## ARTICLE 35

### INVENTORY AND EQUIPMENT.

— 136 —

3° In sailing vessels with iron or steel polemasts the following spare spars will be required for Atlantic and Long voyages : One spar suitable for a topgallant mast or upper-topsail yard.

One spar suitable for a lower topgallant yard.

4° For coasting vessels two spare spars will be required, according to their rig.

---

RULES  
FOR THE CONSTRUCTION OF VESSELS CARRYING OIL  
or other liquid cargoes in bulk.

---

The present article refers to the construction and arrangement of all parts within the range of and affected by the oil or other liquid cargoes, while the Rules for ordinary vessels will in general apply to all other parts. It is however to be understood that this article only applies to vessels classed with one of the navigation marks G, A or L; those intended for other navigations will be specially considered on their merits.

N. B. — The scope of these regulations is to be enlarged further on; but the Administration henceforth claim the right to insist on such additional strength being introduced, as may be found necessary.

---

ARTICLE 36.

GENERAL REQUIREMENTS AND  
RECOMMENDATIONS.

§ 1. — The three deck type is to be preferred in the construction of tank vessels, but other types may be adopted with the sanction of the Administration.

The cargo should be carried to the shell plating, thus avoiding the danger of accumulation of gases; but if it is desired for any special reason to fit a double skin either complete or partial, it will be necessary to provide for

easy means of access to all confined spaces, and for thorough ventilation throughout.

Oil or other liquid cargo spaces, deep waterballast tanks and cofferdams to be divided longitudinally by at least one continuous bulkhead running up to top of expansion trunks, and same to be made oiltight unless otherwise authorized by the Administration. Attention is here drawn to the Suez Canal regulations for the transit of ships laden with petroleum oil in bulk.

These spaces must be divided into transverse compartments by means of oiltight bulkheads, the number

## ART. 36. — TANK VESSELS

### GENERAL REQUIREMENTS AND RECOMMENDATIONS

— 138 —

of which must be sufficient to secure ample stability when filling up or emptying the tanks, and approved of by the Administration. In steamers they should be spaced not more than 28 feet apart.

Each oil compartment to have an expansion trunkway extending to above the crown of the tank, and having a total capacity of not less than six per cent of the capacity of the corresponding oil compartment.

Double bulkheads to be fitted at each end of the spaces allotted to the oil cargo, forming cofferdams extending from the keel to the highest point of the expansion trunkway for the whole breadth of the vessel; they are to be spaced not less than two frame spaces apart, and the space between them well ventilated.

Each oil compartment to be tested before launching or in dry dock by a head of water eleven feet above the crown of the tank, or four feet above the top of expansion trunkway hatch covers, to the satisfaction of the Surveyor.

A complete system of piping and efficient steam pumps of approved design to be fitted to facilitate the handling of cargo or waterballast.

When waterballast tanks are fitted forward of the oil compartments, a separate ballast pump to be fitted forward of the cofferdam bulkheads to fill and empty these tanks

Efficient ventilators to be fitted to all cofferdams, pump rooms and other spaces where required. Efficient means should be adopted for clearing the oil compartments of gas or vapour by injection of steam or artificial ventilation of approved design.

When it is intended to carry ordinary cargoes in the oil compartments, portable ceiling and sparring must be provided, of similar scantling to that required for ordinary vessels; a sounding tube and ventilators to each compartment must be fitted. The oil or any other pipes, valves, and valve rods must be strongly cased in so as to protect them from injury.

It is recommended that the propelling machinery in screw steamers be placed entirely abaft the oil spaces, and separated therefrom by the double bulkheads abovementioned.

If however it is desired to place the propelling machinery amidships, special care must be taken that the shaft tunnel be entirely isolated from the engine space; it must be entered by a separate trunkway from the deck, and have at least two efficient deck ventilators (see § 18 hereafter).

The galley, also main and donkey boiler furnaces must be entirely isolated from all contact with the oil cargo. It is recommended that the donkey boiler be placed above the level of the main deck and no external

doors should be allowed to the donkey boiler firing place unless it is placed on the upper deck abaft oil tanks.

Electric light to be fitted throughout on the double wire system.

The safety of oil carrying vessels chiefly rests on perfect workmanship, ample and careful riveting and efficient connections between all parts. — In order to lessen the number of riveted joints, it is advisable to use channel, Z or other rolled bars, and flanged plates where possible.

#### KEEL.

§ 2. — The flat plate form of keel should be the only form adopted; its thickness to be 20 % above that given in Tables N° 1, and in cases where a double plate keel is required by the Tables, a single plate may be used, the thickness of which should be 75 % over that given in the Table.

It is recommended that the butts of the keel plate be overlapped. Where strapped butts are adopted, double straps must be fitted.

The breadth of the keel plate to be increased by one-half the tabular breadth as given in Tables N° 1, in order that the main frames may have a secure attachment to the thick keel plate (see sketch N° 6.) The adjoining strake of plating will be treated for thickness as bottom plating.

#### FRAMES.

§ 3 — The frames in way of oil compartments are recommended to be made of a single rolled bar equivalent to the tabular compound frames (Tables N° 2).

They may be cut short of the centre keelson plate, by a distance not exceeding 9 inches, in order to allow of a free flow of oil to the pumps.

In vessels with two laid decks, where the frames are cut at the second deck to form an oiltight flat, the frames in the 'tweendecks are to be connected to the second deck stringer plate by large knee plates of the same thickness as the frames, and having not less than six rivets through the frame and in each flange of the connecting angle. (See sketch N° 9.)

#### REVERSE FRAMES.

§ 4. — When compound frames are used, reverse frames will be required as in ordinary vessels, except that they must all extend at least to the deck which forms the top of the tank.

Where bulb angle or Z frames are used, reverse frame angle bars as per Tables N° 2, to be fitted on upper edge of floors.

Where bulb angle frames are used, lug pieces must be fitted in way of side stringers; and where the

## ART. 36. — TANK VESSELS

### FLOORPLATES. — CENTRE KEELSON

— 140 —

stringers are not supported by bracket knees on alternate frames, the lugs must be of sufficient size to take two rivets through the stringer bar.

Each lug to have not less than three rivets through the frame bar.

Where it is desired to dispense with reverse frames in 'tweendecks above oil compartments, efficient webs or partial bulkheads to be fitted in compensation, to the satisfaction of the Administration.

#### FLOORPLATES.

§ 5. — The floorplates to butt against the centre line keelson, and to be connected thereto by angle bars at least  $3 \times 3$  inches, and by knee plates of the same thickness as floor plates, unless flanged or fitted with an angle bar on their inner edge, in which case they may be  $1/16$  less in thickness. These knee plates must be connected to floor plates with an overlapped butt, and their dimensions each way to be  $1\frac{1}{2}$  times the depth of the floor. (See sketch N° 6.)

When the frame numeral is 70 and above, the angle bars connecting the floors and knee plates to the centre bulkhead to be of sufficient size to allow double zigzag riveting in each flange.

The floor plates to be turned up at the bilge as required in ordinary vessels. If preferred, bracket

knees of same thickness as floor plates may be fitted at the bilge and carried up as if floors were turned up. (See sketch N° 7.)

Where the frame numeral is below 50, these knees may be fitted on alternate floors.

Suitable limbers to be cut in the floors at a reasonable distance from each other, to allow of an ample flow to the pumps when the liquid cargo falls below the level of the top of floors.

#### CENTRE KEELSON.

§ 6. — The centre keelson plate or bottom plate of centre line bulkhead to be in all cases continuous all fore and aft with the butts overlapped or double strapped and treble riveted, and of the thickness required for centre intercostal keelsons (Tables N° 3), but may be reduced at ends beyond  $2/3$ rd's length to the same extent as allowed for shell-plating.

The centre keelson plate must be connected to the flat plate keel by double angle bars of the size required for upper deck stringers. If desired, for ensuring greater oiltightness, these bars may be cut in way of transverse bulkheads, but it is recommended to fit them continuous even if the bulkhead is not oiltight.

No limber or manholes to be cut in the centre keelson plate.

The centre keelson plate should be made sufficiently deep to cover the whole height of floor knee plates.

#### BOTTOM KEELSONS.

§ 7. — The arrangements of the bottom keelsons to be as per Plate E (after page 128). The size of the keelson angles and thickness of the intercostal plates are given in Tables N° 3 for ordinary vessels.

The keelson angles &c., may be cut in way of transverse bulkheads, provided efficient compensation is given by means of brackets of same thickness as keelson angles and well riveted together across the bulkheads with double angles of same size as stringer angles. (See Sketch N° 2.)

When the keelson angles as given in Tables N° 3 are  $6 \times 4$  ins. and above, the bracket knees connecting same to transverse bulkheads should be stiffened on edge by an angle bar of reverse frame size, or edge of plate may be flanged.

#### WEB FRAMES.

§ 8. — All vessels to be fitted with web frames in way of the oil compartments, the spacing and arrangement of which will be according to Plate E.

Web frames to be of the same thickness as the tabular frames, and their width not to be less than four times the broad flange of the tabular frame angle.

Double angles of reverse frame size to be fitted on inner edge of web frames, and carried across top of floors to centre line.

Web frames to be connected to the ends of the floor plates by at least a treble riveted lap butt; the remaining butts may be double riveted.

The web frames may be cut in way of the side stringers, or side stringers in way of web frames and connections made by double angles above and below, of reverse frame size, and by a diamond plate  $30 \times 24$  ins. where the web plate is above 18 wide, and  $24 \times 20$  ins. where 18 ins. and below in width, the larger size being placed in the direction of the member which is not continuous.

These diamond plates to be of same thickness as the web frames.

Web frames to be connected to the shell plating by double angles of approved size, or by a single angle with the flanges both equal to the moulded flange of the tabular frame angles.

Where web frames in 'tweendecks are increased in width they may be reduced  $1/16$  in thickness if  $7/16$  thick or above.

#### SIDE STRINGERS.

§ 9. — The number and arrangement of the side

## ART. 36. — TANK VESSELS

### SIDE STRINGERS. — TRANSVERSE BULKHEADS

— 142 —

stringers in way of oil compartments to be as per Plate F.

The width and thickness of these stringers to be the same as that of the web frames. They may be intercostal between the web frames or be carried continuously through the web frames, and connected to them as specified in the preceding paragraph.

The side stringers may be cut in way of the transverse bulkheads, provided compensation be given in the form of bracket knee plates of same thickness as side stringers, connected to bulkhead plating on each side by means of angle bars both above and below the stringer plate, of same size as required for deck stringers, and close riveted in each flange. (See sketch N° 1A). The stringer brackets to have a connection to the bulkheads of not less than three times the width of the side stringer and to extend for an equal distance in a fore and aft direction, and be adequately stiffened. The stringers to be overlapped with the brackets, and at least treble riveted to them.

If the side stringer plates are carried through the bulkheads, double angle collars, made thoroughly oiltight, are to be fitted on each side of the bulkhead plating, and the width of the stringer plating is to be increased in way thereof to double its original breadth (see sketch N° 1); or any other approved method may be adopted, with the sanction of the Administration.

The side stringers to be connected to the shell plating by an intercostal angle bar of the same size as required for deck stringers, having not less than seven rivets in each frame space and in each flange where the angle is 4×4 ins. and above, and six rivets where less. These angles must be double for at least three frame spaces on each side of the transverse bulkheads. An angle bar of the same size as above is to be carried along the inner edge of frames, and double angle bars must be fitted on the inner edge of stringer plate, and carried along the inner edge of bracket knee, or single angle of keelson size may be fitted.

Stringer angle bars may be cut, if desired, in way of transverse bulkheads.

Where side stringer plates are 18 inches and above in width, they must be supported by bracket knees of same thickness as the frames, and not more than two frame spaces apart.

### TRANSVERSE BULKHEADS IN OIL COMPARTMENTS

§ 10. — The thickness of plating, size and spacing of vertical stiffeners and size of horizontal stiffeners for oiltight bulkheads is given in the Table D at the end of this article. The horizontal stiffeners should be placed in line with the side stringers and be well riveted to the bracket knee plates. (See sketch N° 1A.)

The vertical stiffeners to be connected to the floor plates and to the deck above by bracket knee plates of same thickness as stiffeners. (See sketch N° 3.)

It is recommended that the bulkheads be connected to shell and deck plating by means of a single frame, with each flange the same breadth as the moulded flange of the ordinary frame, and double riveted.

In way of outside strakes of shell plating, bulkhead liners need only be fitted of a sufficient breadth to take one row of rivets on each side, outside of the frame bars. (Sketch n° 4.)

In vessels whose beam exceeds 36 feet, a vertical web plate of same thickness as bulkheads to be fitted on same midway between the centre line bulkhead and the side of ship on each side, not less than 24 inches wide at bottom; it should be stiffened by edge angle bars, and connected to floors and deck plating by strong plate knees.

Where the beam of the vessel exceeds 42 feet, two of these webs will be required on each side.

When the horizontal stiffeners are 12 inches broad and above, bracket knee plates of same thickness as stringers should be fitted to support the same, and spaced not more than six feet apart.

Bulkheads forming cofferdams to be efficiently connected together by means of gussets and brackets for support when under pressure.

Sketch of proposed arrangements to be submitted.

Also large bracket knees or webs must be fitted and carried down to the bottom against the cofferdam bulkheads outside of the oil compartments to the satisfaction of the Administration.

No doors or sluice valves are to be cut in the bulkheads of cofferdams below the level of the deck forming the crown of the oil tank, and in vessels with two decks where it is desired to cut doorways in the 'tween decks, they must be at least 18 inches above the deck level and fitted with solid watertight doors of approved construction.

Where a cast iron frame with india rubber joint is adopted, the rubber should be placed on the bulkhead face inside the cofferdam, and no permanent overhead rail should pass from the tweendeck through the bulkhead doors.

If it is desired to adopt any other mode of stiffening the bulkheads than that indicated above, details of such arrangement must be submitted for the approval of the Administration.

If it is proposed to use certain of the oil compartments for waterballast, the spaces intended to be so used must be indicated on the plans submitted for approval, so that the need of additional stiffening of the end bulkheads of these spaces may be considered and decided upon by the

Administration. In that case the vertical stiffeners should be on the bulkhead side opposite to waterballast.

(It should be understood that on no account is waterballast to be pumped in or out of the holds or cofferdams at sea, beyond that which is necessary for keeping tanks full in case of leakage.)

#### LONGITUDINAL BULKHEADS IN OIL COMPARTMENTS

§ 11. — The thickness of plating and size of stiffeners, &c., to be the same as required for the transverse bulkheads, the bottom strake excepted, but the vertical stiffeners must be spaced like the frames, and well connected to the floor knees and to the deck beams above by knee plates of same size as the ordinary knees.

The horizontal stiffeners should be placed in line with the horizontal stiffeners on the transverse bulkheads, and be connected to them by bracket knees of same thickness, having a breadth each way measured from the bulkhead of three times the width of the stiffener. On the opposite side of the bulkhead a knee plate of the same dimensions is to be fitted, and well riveted to the bulkhead plates. (See sketch N° 1.)

The longitudinal bulkhead plating may be carried continuously fore and aft through the transverse bulkheads, or it may be cut in way thereof: excepting the

bottom plate or centre keelson, which must in all cases be continuous all fore and aft.

The longitudinal bulkhead to be connected to the transverse bulkhead plating by a single angle of the size required for bulkhead frame bars, double riveted in each flange, or by double angles.

The longitudinal bulkhead to be also additionally stiffened for its full height by web plates placed in line with the web frames on the side of the vessel, of the same thickness as the bulkhead plates, and not less than two feet broad at the foot, with knee plates to floors and deck beams; the edge of the web in addition to be stiffened by an angle of reverse frame size.

Longitudinal bulkheads must not be abruptly terminated, but tapered away at the ends for a distance not less than one-third the depth of the bulkhead from keel to crown of tank.

The scantlings for oiltight bulkheads as given in Table D will apply to the longitudinal bulkhead, whether made oiltight or not. (See § 1.)

#### GENERAL AS TO OILTIGHT BULKHEADS.

§ 12. — The horizontal and vertical stiffeners as given in Plate E must be placed on opposite sides of the bulkheads.

If it is desired to fit both horizontal and vertical

stiffeners on the same side of the bulkhead, special plans should be submitted for the approval of the Administration.

The horizontal stiffeners on all oiltight bulkheads to be connected thereto by single angles of the size given in Table D (care being taken that both flanges there of take the same number of rivets), and to have a corresponding angle on the face of stringer, connected to the face angle of the side stringers by butt covering pieces where possible; or stiffeners of equal sectional area, formed of channel bar, may be fitted if preferred.

Oiltight bulkheads to be constructed without the use of felt, packing or white lead, and all plates made to fit fair metal to metal.

It is recommended that the bulkheads and all their vertical and horizontal stiffeners and connecting angles should be thoroughly caulked on both sides.

#### PILLARS.

§ 13. — In vessels whose breadth exceeds 42 feet, quarter pillars should be fitted in each oil compartment, well riveted to the floors and deck beams; where the length of the compartment is 24 feet, one pillar will be required and above this length two pillars in each compartment. Pillars of channel section are recommended.

If preferred heavy beams connected by large brackets

to the web frames and centre bulkhead buttresses may be adopted, in which case the scantlings of the whole transverse member shall be increased to the approval of the Administration.

#### BEAMS.

§ 14. — The depth and thickness of deck beams and their angles to be the same as that required for ordinary vessels.

The arrangement of the beams is given in Table D, the depth being measured as in ordinary vessels.

No reduction to be allowed in the scantlings of half-beams of upper or second decks, in way of oil compartments.

Strong beams in all cases to be fitted at the head of web frames on the deck which forms the crown of the tanks. These beams to be connected to the web frames by large knee plates well riveted to the web plate. (See Sketch No 5.)

All beams in way of oil compartments to have knee plates at least three times the tabular depth of the beam in length, and to be well riveted to the frames with at least six rivets, but the rivets not to be more than  $4\frac{1}{2}$  diameters apart from centre to centre.

Beams at ends of hatches in way of oil compartments to be increased in size as required for ordinary vessels,

## ART. 36. — TANK VESSELS

### DECK STRINGERS AND PLATING EXPANSION TRUNKS

— 146 —

(See Art. 16), if not already increased as being on top of web frames.

#### DECK STRINGERS AND PLATING.

§ 15. — Deck stringer plates in all cases to be carried continuously through the transverse bulkheads, and connected to the frames and shell plating by angle bars as required for ordinary vessels; there are not to be less than six rivets in each flange of the intercostal shell bar in each frame space.

Where the stringer bar forms an oiltight connection between the deck and the shell plating, it must be increased half an inch in size and double riveted in each flange in way of oil compartments.

Iron or steel decks are to be fitted as required by the Rules for ordinary vessels, but in no case should the deck forming the crown of the oil tanks be less in thickness than  $12/32$  steel or  $7/16$  iron, or the deck forming the top of the expansion trunks be less than  $10/32$  steel or  $6/16$  iron.

It is recommended that the deck plating inside the expansion trunks be left as open as possible, to facilitate ventilation of holds, but the deck must be plated over in way of both longitudinal and transverse bulkheads for a width of at least 2 feet on each side of bulkhead plating.

The deck plating must be increased in thickness in way

of hatches, &c., as required for ordinary vessels. (See Art. 20 & 22.) When oil hatchways on upperdeck are continuous, the deck plate next to them on either side should be doubled for half the length of vessel amidships.

#### EXPANSION TRUNKS.

§ 16. — All compartments must have suitable oiltight spaces extending above the deck forming the crown of the tanks, for the purpose of allowing the liquid cargo to expand or contract.

Each trunk is to have a capacity of not less than six per cent of that of the corresponding oil compartment.

The plating to be of the same thickness as the upper part of the bulkheads, as given in the Table D at the end of this article.

The stiffeners on the trunk sides and ends to be of the same scantlings and spacing as the tabular frames, and, where possible, to be placed in line with the deck beams, and connected to same both above and below by bracket knee plates of same thickness as stiffening angles.

All oiltight corner bars in expansion trunks to be at least of the size required for deck stringers (Tables N° 6), and double riveted in each flange.

Web plates of the same thickness as the trunk side

## ART. 36. — TANK VESSELS

— 147 —

### SHELL PLATING. — ENGINE AND BOILER SPACE

plating, to be fitted in the expansion trunks at ends of all hatchways.

In way of hatches in expansion trunks, the trunk side plating to be carried down and connected to the half beams in way thereof, as required in ordinary vessels.

Where the deck plating is flanged in way of expansion trunks, a fore and after of same scantlings as beams is to be fitted in way of half beams.

Hatchways with oiltight hatch covers made of iron or steel and of approved pattern must be fitted over each expansion trunk; the openings to be of sufficient size to allow of holds being efficiently ventilated.

Where the upper deck beams are cut in way of trunk sides, they must be efficiently connected thereto by knees of not less size than those fitted at ship's side.

In cases where the spaces at sides of expansion trunks are used as spare bunkers, or where any large quantity of coal is carried in the 'tweendecks, the deck in way of same must be coated with an approved composition, which should be examined at least every two years, and renewed where and when found necessary.

When the longitudinal bulkhead is carried up to form a central division in the expansion trunks, it may be  $1/16$  inch less in thickness than the trunk sides, and the

stiffeners may be of reverse frame size, spaced at the same distance as the main frame, except where the longitudinal bulkhead is oiltight, in which case the scantlings must be the same as the trunk side.

### SHELL PLATING.

§ 17. — With the exception of the keel plate (See § 2), the shell plating to be as required for ordinary vessels, except that only 50 % of the reduction by Table N° 1<sup>5</sup> will be allowed in the after part of screw steamers up to the counter, when engines are placed aft.

All butts of shell plating should be overlapped in way of oil compartments, and must be at least treble riveted.

If the butts of the shell plating are strapped in way to oil compartments, double straps should be fitted, treble riveted, with three rows of rivets on each side of the butt.

All seams to be double chain riveted in way of oil compartments.

### ENGINE AND BOILER SPACE.

§ 18. — Where the propelling machinery is placed in the stern abaft the oil compartments, the same arrangement of side stringers and web frames to be carried out through these spaces as in the oil compartments.

No reduction will be allowed at the after end on the

## ART. 36. — TANK VESSELS

### ENGINE AND BOILER SPACE. — RIVETS AND RIVETING

— 148 —

bottom plating up to the counter, when the engines and boilers are placed aft.

When a waterballast tank is placed aft under the engine and boiler spaces, the scantlings of floors, intercostal girders, tank top plating, tank margin plate, and centre keelson must be regulated as though the tank were placed amidships, and increased as per rule in engine and boiler space. (Art. 25 & Table N° 4.)

The web frames to be connected to the margin tank plate by double angles, and by a gusset plate or half diamond plate riveted to the reverse frames and the tank side plate.

When the propelling machinery is placed amidships, double cofferdam bulkheads extending to the upper deck are to be fitted at each end of the machinery space, to secure complete isolation from the oil compartments.

The shaft tunnel must be entered by means of a trunkway from the deck, placed abaft the ordinary cofferdam bulkheads, and a similar trunkway must be placed at after end of tunnel for ventilation.

Details to be submitted for the approval of the Administration of the proposed method of constructing the shaft tunnel.

The cofferdam bulkheads at ends of engine and boiler space to be especially strengthened by means of bracket

knees and buttresses, and where the centre longitudinal bulkhead is dispensed with, the strength should be gradually tapered off, or efficient compensation given.

The cofferdam bulkheads are not to be pierced for any valves or doors, except as previously specified for cofferdam bulkheads at ends of oil compartments. (See § 10.)

Where the shaft tunnel passes through the cofferdam bulkheads, particular care should be taken to ensure oiltightness.

### RIVETS AND RIVETING.

§ 19. — The diameter of rivets, the breadth of laps and butts, &c., in way of the oil compartments will be regulated by the thickness of the plates as given in Table N° 7, except that no rivets less in diameter than  $3/4$  inch will be allowed in the oil compartments where subject to pressure.

FORM OF RIVETS. — The form of rivets to be used in the construction of the oil compartments are shown in sketch N° 10. In oiltight bulkheads and all parts where the pressure may come from either side and where more than two plates are to be connected, the flush headed countersunk rivet or plug-headed rivet is recommended to be used, but care must be taken that the head of the rivet projects beyond the plate at least

a quarter of an inch, and that there is sufficient spread on the head of the rivet to prevent its being drawn; where the pan-headed rivet is used, it must be swollen out under the neck in order to fill the drift of the punch, and great care must be taken that it is driven up fair, so that the pan head bears on the plate all round; any rivets which do not fulfil this requirement must be cut out and renewed.

The rivets in the bracket knees connecting the keelsons and stringers and floors where cut at the transverse and longitudinal bulkheads, to be especially attended to as regards fitting and riveting, and rivets left full or convex as in boiler riveting.

All rivet holes must be as fair as possible, and where any slight unfairness occurs, the holes must be carefully rimed out, and not drifted with a punch.

The requirements for riveting given in Article 27 are also to apply to riveting in oil compartments with the following exceptions.

**OUTSIDE PLATING.** — The spacing of the rivets in each row of the seams of outside plating not to exceed  $3\frac{1}{2}$  diameters for double chain riveting and no seams of shell plating to be single riveted in way of oil compartments.

**BULKHEADS.** — The butts and seams of all oiltight

and cofferdam bulkheads to be double chain riveted and spaced not more than  $3\frac{1}{2}$  diameters apart.

In case the longitudinal bulkhead is not intended to be oiltight, the butts and seams above the bottom strake may be single riveted, with rivets spaced  $4\frac{1}{2}$  diameters apart, but the upper edge of bottom strake must in all cases be double riveted.

The butts of the centre keelson plate to be treble riveted throughout.

All oiltight bulkhead frame bars, corner angles and collars subject to oil pressure, to be of sufficient size to allow of double zig-zag riveting, and the spacing of the rivets in each row not to exceed 4 diameters.

Where the bulkhead stiffeners, both vertical and horizontal, are caulked, the spacing of the rivets should not exceed 4 diameters, but when they are not caulked the spacing of the rivets must not exceed 6 diameters apart.

**DECKS.** — The seams of the deck plating forming the crown of oil tanks to be double chain riveted, and the butts must be at least double riveted, and treble riveted where required, the rivets in butts and seams not being spaced more than  $3\frac{1}{2}$  diameters apart.

**EXPANSION TRUNKS.** — The seams of plating forming the expansion trunks may be single riveted, but the butts should be double riveted; the rivets to be spa-

## ART. 36. — TANK VESSELS

### PERIODICAL SURVEYS.

— 150 —

ced 3 diameters for single riveting and  $3\frac{1}{2}$  diameters for double. The above rule also applies to deck plating where it forms the top of the expansion trunks.

**FRAMES AND BEAMS.** — The rivets connecting the frames to the shell plating and the beams to the deck plating not to be spaced more than  $6\frac{1}{2}$  diameters apart.

The packing between top of beams and outside deck strakes to be fitted in short pieces, or washers substituted, to allow of the free escape of gases.

The rivets in the frame bar of all web frames, where a single bar is used, to be double zig-zag riveted and spaced not more than 7 diameters in each row of each flange.

The rivets connecting the deck beam knees to the frames not to be spaced more than  $4\frac{1}{2}$  diameters apart, and to have at least 6 rivets in each knee.

**BRACKETS.** — The rivets in all bracket knee plates which are fitted to maintain the longitudinal or trans-

verse strength where it has been interrupted, to be double zig-zag riveted with the rivets spaced not more than  $4\frac{1}{2}$  diameters in each row in each flange. (See sketch N° 1A.)

The rivets in the side stringer shell bars to be close spaced as previously mentioned, viz. : Seven rivets in each frame space where the intercostal shell bar is  $4' \times 4''$ , and 6 rivets where the angle bar is of less size.

### PERIODICAL SURVEYS.

§ 20. — In all cases when the periodical survey is due as prescribed by Article 6 of the Rules, it will be necessary to test all compartments, the same as is required for waterballast tanks; the pressure need not exceed that of filling the tank to the level of the hatch covers.

For purposes of inspection the tanks must be thoroughly cleared and cleaned of gas and every precaution taken to secure safety.

Table D<sup>3</sup>. — STEEL SCANTLINGS OF LONGITUDINAL AND TRANSVERSE OILTIGHT BULKHEADS IN TANK VESSELS.

Bulb Angles

\* The depth is to be measured as specified in Art. 10.

In vessels whose beam exceeds 36 feet a vertical web plate of same thickness as bulkheads must be fitted midway between the centre line bulkhead and side of ship on each side. — Where the beam exceeds 42 feet two such webs must be fitted.

SKETCHES SHOWING THE  
STRINGERS, KEELSONS AND WEB FRAMES

ARRANGEMENT OF BEAMS,  
IN TANK VESSELS. (See ART. 36.)

N. B. — The depth to be measured to upper deck in all cases. The number of side stringers and arrangement of web frames to be regulated by the depth; the arrangement of bottom keelsons to be regulated by the breadth.

Where strong hold beams are required, they must be fitted in way of each web frame, and the side stringer in way thereof is to be increased to the width required for lower deck stringers. (Tables N<sup>o</sup> 6.)

Bulbs to be of the size required for 2<sup>d</sup> deck beams. (Tables N<sup>o</sup> 5.)

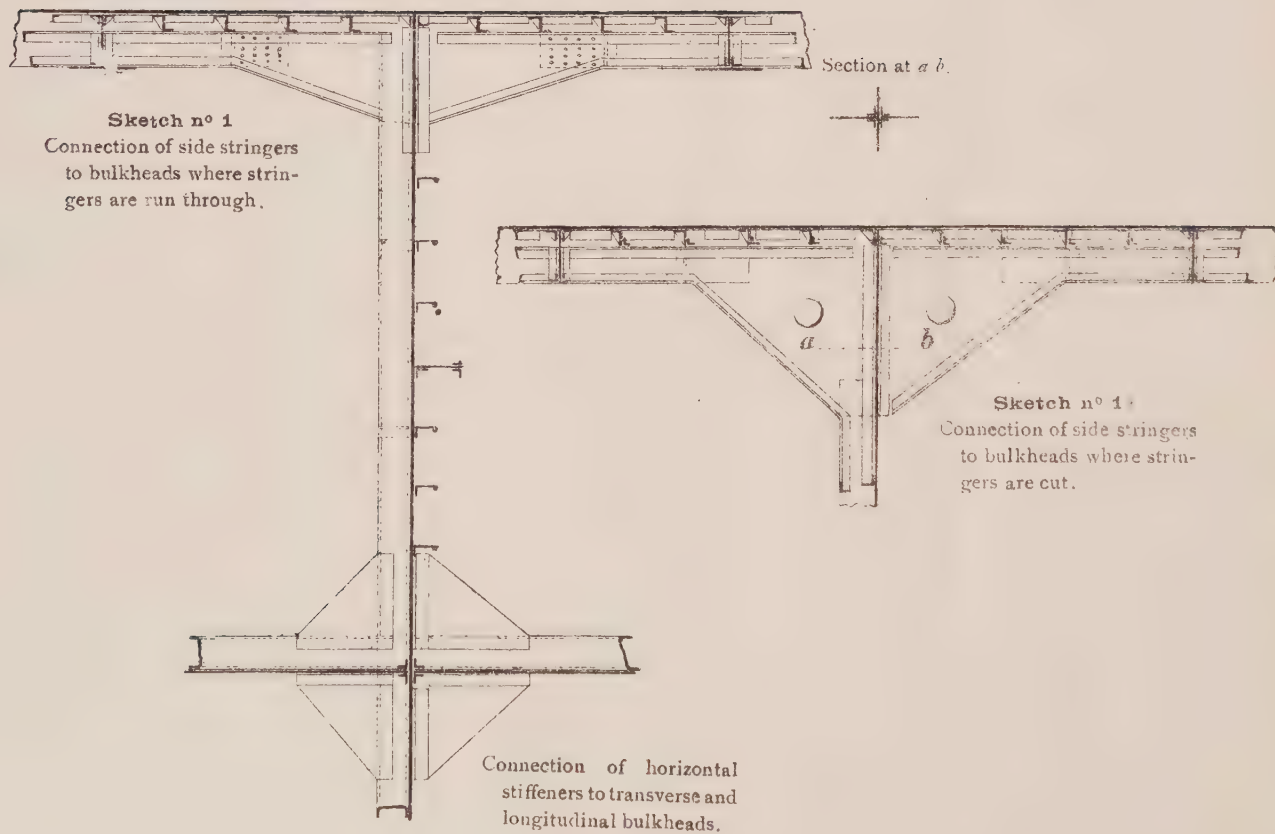

Keelson plates to be of a depth equal to twice the broader flange of the keelson bars.

Keelson bars to be of the size given in Tables N<sup>o</sup> 3.

## RULES

## FOR THE CONSTRUCTION OF DREDGERS AND HOPPER BARGES

## ARTICLE 37

## NUMERALS.

§ 1. — The numerals are to be obtained in the same manner as for single deck vessels (see Arts. 9 & 10).

For extreme proportions the ratio of length to depth (to upper deck) may be reduced by 2.

In way of raised decks, having a height of or over 2 ft., the arrangement of beams, side stringers, and reverse frames shall be determined with reference to the depth to the raised deck.

## SCANTLINGS.

§ 2. — A reduction of 10 % from all scantlings (area of sectional material) given by the Tables will be allowed, with the following exceptions :

Keel Plate, Area of Stem and Sternposts. 15 %.

Thickness of Sheerstrake (see § 14) . . 18 %.

## FREEBOARD.

§ 3. — The freeboard will be determined with refe-

rence to the scantlings and general design of the vessel.

## KEEL.

§ 4. — As a rule, the keel to be of the flat plate type, connected to an intercostal or centre-through keelson by double angles.

In way of a hopper the continuity of strength at the centre line is to be adequately maintained by means of a girder of efficient arrangement and scantlings.

## FRAMES.

§ 5. — The frame spacing to be as required by Table N° 1.

Single frames will be admitted for the connection of bulkheads to outside plating and decks, provided the width of the flanges be sufficient for double riveting.

## REVERSE FRAMES.

§ 6. — These are to be fitted on every floor. In vessels under 10 ft. depth moulded reverse frames will be required on top of floors only.

## ART. 37. — DREDGERS

### FLOORS — HOPPERS AND WELLS

— 154 —

When the depth is 10 ft. and under 13 ft. 6 ins. alternate reverse frames shall extend to the deck.

In vessels having a depth of 13 ft. 6 ins. and under 16 ft. 6 ins. they shall extend to the deck and bilge stringer alternately; and to the deck and hold beam stringer alternately when the depth is 16 ft. 6 ins. or above.

Double reverse frames are to be fitted from bilge to bilge on each floor in way of all engines and boiler beavers.

#### FLOORS.

§ 7. — The top edge of floor plates may be horizontal from bilge to bilge.

In way of hoppers and wells the depth of floor plates may be reduced by 20 % from the depth given in Table No 2.

Knee plates of the same thickness as the floors must be fitted at every frame to connect the hopper or well side framing with the floor plate.

Larger knees or deep floors should be fitted in line with the transverse plate girders at the bottom of the hopper.

#### WEB FRAMES

§ 8. — The general arrangement of web frames is to be in accordance with Art. 16.

In dredgers web frames will be required in way of stays to the superstructure for bucket ladder.

At the bottom of the hopper in hopper barges transverse web plates, about 5 frame spaces apart, are to be fitted in order to tie together the sides of the vessel and provide an abutment for the hopper doors. These web plates are to be of the same thickness as floor plates, and stiffened with angle bars as may be required.

#### KEELSONS

§ 9. — The general arrangement of keelsons and bilge stringers to be in accordance with requirements of Art. 17.

The centre keelson, as a rule, to be of the intercostal type, with two continuous angle bars on top of the floors, and double angles to the keel plate.

Special precautions must be taken to maintain continuity of strength where keelsons or stringers may be terminated. If interrupted at a bulkhead, they should be carried through same for about 3 frame spaces.

#### HOPPERS AND WELLS.

§ 10. — The side plating of hoppers and wells to be of the same thickness as the shell side plating, with the exception of the bottom strake in wells, which is to be 20 % thicker.

The side plating of hoppers or wells may require to be scarphed to the bottom and deck plating by means

of large brackets or diaphragm plates extending about 3 frame spaces beyond the ends of the hopper or well.

The sides of a hopper are to be stiffened with angle bars of the same scantlings and spacing as the main frames, alternate ones being stiffened by web plates or by efficient diagonal struts extending from the hopper to the ships sides and well bracketed to frames and stiffeners.

The special centre line girder at the bottom of the hopper is to be efficiently stiffened with web plates and angles as may be required.

#### WATERTIGHT BULKHEADS.

§ 11. — The arrangement and construction of watertight bulkheads to be as required by Art. 23.

Bulkheads at the ends of hoppers are to extend from side to side of the vessel.

The thickness of these bulkheads to be the same as the hopper sides; and web plates are to be fitted to alternate stiffeners when the breadth of the bulkhead is less than 29 ft. 6 ins.

When the breadth of the bulkhead exceeds 29 ft. 6 ins each stiffener is to be fitted with a web plate.

Stiffeners and web plates to have knee plates at top and bottom.

Longitudinal bulkheads to be fitted with vertical stiffeners of the same scantlings and spacing as the

main frames also with horizontal stiffeners of suitable scantlings.

Diaphragm and gusset plates to be fitted to the bulkheads at the ends of raised decks. (See Art. 10 § 4.)

#### BEAMS

§ 12. — Short beams in way of hoppers may be of the scantlings required for frame angles.

In way of wells in dredgers the scantlings of the beams shall be as required for half beams in way of hatchways (Art. 16).

The sides of the vessel to be tied together at the level of the deck by means of strong plate webs or beams spaced about 5 frame spaces apart so as to correspond with the deep floors referred to in § 8. These beams to be strongly constructed of plates and angles and are to extend from side to side of the ship; or if stopped at sides of the hopper, their strength is to be continued out to the ships sides by means of deep web plates and angle bars.

Strong beams will be required in way of winches, windlasses and similar deck machinery, in way of superstructure for bucket ladder, and in the engine and boiler space.

For other requirements, the general provisions of Art. 16 are to be followed.

## ART. 37. — DREDGERS

### DECK STRINGERS AND PLATING — PUMPING. — 156 —

#### DECK STRINGERS AND PLATING.

§ 13. — In way of a hopper the deck stringer plate shall extend from the ships sides to the sides of the hopper; at the ends of the vessel it may be gradually, reduced to the width given in Table N° 6.

Its thickness for the length of the hopper shall be as given by Table N° 6 without any reduction by § 2.

At breaks of raised decks the stringer plates are to be scarphed part each other for a distance of about 4 frame spaces, and other compensation made as indicated in Art. 10.

In way of hatch openings, such as for engines and boilers, central wells of suction dredgers, etc., the deck is to be plated over between the stringer plate and side of the opening, if the length of the openings exceed 9 frame spaces.

The deck is to be plated over in way of bucket ladder framing of dredgers, and at ends of wells and hoppers.

The beams shall be plated over, with plating of the same thickness as the stringer plate, in way of bollards, winches, windlasses and other deck machinery.

If a wood deck be adopted instead of iron, the usual tie plates shall fitted as per Art. 19.

The thickness of chequered plates for decks is to be taken to the bottom of the chequer.

#### SHELL PLATING.

§ 14. — The sheerstrake may be reduced in thickness as per § 2, provided fenders are fitted at the gunwale between double angle bars of at least upper deck stringer angle scantlings, with their butts properly shifted and scarphed.

In way of the break of a raised deck the sheerstrake to be increased in thickness by  $2/32$  in.

The strake of plating adjacent to a well or hopper shall be increased by 20 % in thickness over the whole length of, and for at least 4 frame spaces beyond, the ends of the well or hopper.

#### RIVETING

§ 15. — The riveting to conform to the requirements of Art. 27, but a uniform diameter of rivet may be adopted throughout the hull. This diameter to be as required for side shell plating.

#### PILLARS

§ 16. — Pillars to be fitted under all deck machinery, and elsewhere as may be required by the Administration. For general requirements see Art. 21.

#### PUMPING

§ 17. — The pumping arrangements to be as per Art. 23, a plan of same being submitted for the approval of the Administration.

## ELECTRIC LIGHTING

## ARTICLE 38

## ELECTRIC LIGHTING

§ 1. — **DYNAMOS** to be of an approved type; continuous currents are to be preferred, and the voltage should not exceed 120. The engines should be fitted with a governor and situated in the engine room or in a separate adjacent compartment and efficiently ventilated.

§ 2. — **SWITCH BOARDS.** — The fittings on main switch board should be mounted on slate or other incombustible material, placed not far from the dynamos, and be accessible from the back if possible, unless all connections be established on the front of the switch board. From this the main circuits should be led to auxiliary switch boards for distributing the current to the various branches which may not be taken directly off a main cable.

A voltmeter for each installation and an ampèremeter for each dynamo to be supplied.

§ 3. — **LEADS** to be of copper wire having a conductivity of a least 98 %. Single wires should not be less than 20 S. W. G. with a sectional area of at least 1 square inch per 1250 ampères. The insulation on the leads should be absolutely watertight and be capable of bearing a temperature of 150°F. without being softened. All cables should have an insulation resistance of not less than 700 megohms per statute mile after 24 hours immersion in sea water at a temperature of 60° F.

If alternating currents are used the insulation must be double that required for a continuous current of same voltage.

It is recommended to test the insulation of the electric plant before proceeding on a long voyage.

Leads should be accessible. In cabins they should be laid in battens with covers screwed on; where exposed to moisture they should be lead covered, and be armoured or protected by galvanized iron casings in cargo holds or wherever liable to be injured.

Watertight packings of an approved type must be fitted where leads pass through decks or watertight bulkheads, and the leads should be carefully protected from chafing against holes in beams, etc. All bends should be as easy as possible.

§ 4.— **JOINTS** must be carefully made and insulated to the same degree as the cables and should be in places always accessible.

Resin should be employed as a flux for soldering.

In the double wire system joints in flow and return wires should not be opposite one another.

In single wire plants the joints with hull must be accessible. Large cables should be secured in a copper plate bolted to the steelwork of the hull which should be scraped bright at the contact, the area of contact being at least five times the sectional area of cables. A brass screw with non-oxidizable washer may be employed for single lamps and small cables.

§ 5. — **SWITCHES** should be made so as to act quickly and be either full on or off without remaining in an intermediate position.

They should have large rubbing surfaces and be so arranged that the friction takes off the oxide formed. A switch should be fitted to each main and branch circuit and the more important ones arranged so as not to be

tampered with by irresponsible persons. In places affected by moisture they should be fitted in watertight boxes having portable covers.

§ 6. **FUSIBLE CUT-OUTS** should be fitted as a rule at the origin of each branch circuit, and be situated close to switch, those for the larger cables being placed on the switch board. In double wire plants a cut out should be fitted the origin of each wire of each circuit. Like switches they should be placed in accessible positions and arranged so as not to be tampered with, be mounted on an incombustible base, and be fitted with a strong incombustible cover which should be watertight where exposed to moisture. They must melt with a current double the normal one i. e. at 2500 amperes per sq. in. and care must be taken to avoid mistakes in the size of fuses.

§ 7. — **LAMPS** to be of an approved pattern, strong, well insulated and efficiently secured in their sockets.

Those in machinery space must be watertight and be protected by a glass globe with wire netting.

In crew spaces, passages, holds, etc., they must be of a strong pattern efficiently protected by wire guards. Deck lamps as well as side and masthead lamps must be perfectly watertight and be fitted with detachable connections.

§ 8. — **IN OIL VESSELS** alternating current dynamos are strictly prohibited and single wire plants should not be fitted.

The insulating material must be such as not to be injured by oil or vapours.

The leads must not be run through the tanks, and no switches, cut outs or joints may be placed in pump room.

All parts of circuits or fittings where sparks might be produced must be above the tank deck and situated where no gas can accumulate.

Arc lamps may not be used and all incandescent deck and hold lamps are to be strongly protected by airtight globes with wire netting.

§ 9. — **COMPASSES.** — The following precautions are recommended in order to lessen the deflections produced by electric currents: compasses, especially the standard compass should be at least 33 ft. from any continuous current dynamo or electro motor, and 50 ft. from alternating current machines. No single wire to be nearer a compass than 16 ft.; and if this be not possible the double wire or concentric system should be adopted in the vicinity of the compass. Chronometers also should be kept at a fair distance from dynamos and leads.

The influence of electric currents on compasses must be tested when these are being adjusted, with the vessel's head in any position and with all possible

arrangements of current in the leads likely to affect the compass.

## ARTICLE 39

### OIL FUEL INSTALLATIONS.

The following rules apply to installations for burning oil fuel, having a flash point of at least 200° F. If fuel having a lower flash point be used, special arrangements should be adopted and submitted to the Administration for approval.

§ 1. — Oil fuel may be carried in the double bottom, bunkers, peaks or other suitable compartment. Such spaces shall be built as « Tanks », carefully strengthened and riveted, the requirements of Art. 36 relating to tank vessels being taken as the basis of construction. They shall be tested by a head of water as high as the upper deck, and at least 13 feet above the crown of the tank.

§ 2. — In all cases, a « settling tank » must be fitted, into which the oil shall be pumped before passing to the burners, so as to separate from it any water which may have accidentally found its way into the tanks or pipes.

§ 3. — Wells shall be formed at the ends of oil fuel

tanks in the double bottom in order to collect possible leakage of oil or water.

§ 4. — Where an oil fuel tank is adjacent to a cargo hold, proper means (preferably cofferdams) must be adopted to prevent the cargo coming in contact with the sides of the tank, and oiltight wells fitted round the tank in the cargo or machinery spaces in order to collect any leakage which might find its way through the tank bulkheads into these spaces. These wells must be at least two feet deep, be quite separate from the hold wells or bilges, and be fitted with sounding pipes and suction.

§ 5. — Where oil fuel tanks are close to boilers or uptakes, special means of insulation must be fitted between the boiler and the tank to the satisfaction of the Surveyor.

§ 6. — The pumping system to the oil tanks and wells must be totally separate from the bilge or ballast pump system.

§ 7. — All fuel tanks and cofferdams must have efficient means of ventilation in order to ensure the safe escape of dangerous gases.

§ 8. — A plan of the whole arrangements should be submitted for the approval of the Administration.

## RULES FOR REFRIGERATING MACHINERY, ETC.

## ARTICLE 40

## RULES FOR REFRIGERATING MACHINERY, ETC.

The Administration of the Bureau Veritas are prepared to issue Special Certificates to vessels having Refrigerating Machinery and Insulated Holds for carrying frozen cargoes, provided that such machinery and holds have either been constructed under the Special Survey of the Bureau Veritas, or have been surveyed after their construction and found to satisfy the requirements of the following Rules :

When the Refrigerating Machinery and Holds have been constructed under Special Survey of the Bureau Veritas the mark ✠ R. A. C. with date, will be entered in the Society's Register against the name of the vessel ; and the mark R. A. C., with date, when they have undergone survey after construction.

## RULES.

§ 1. — Refrigerating Machinery to be of an approved type, and of sufficient power to keep the cargo holds at the required temperature in a tropical climate, when working for 18 hours per day.

When the total capacity of the refrigerated spaces exceeds 70,000 cubic feet the machines to be either duplex, or in duplicate.

§ 2. — The Machine Room to be well ventilated and drained, and separated from the cargo holds by watertight bulkheads or decks.

§ 3. — Brine Circulating Pipes and Tanks should not be galvanised on the inside ; but, when they are so galvanised, the tanks, if closed, should have ventilating pipes leading to the atmosphere, and, if open, the chamber containing them to be well ventilated.

§ 4. — In the refrigerated spaces all the floors, sides

## ARTICLE 40

### REFRIGERATING MACHINERY.

— 162 —

decks, and all exposed metal, must have thorough insulation, efficiently constructed, and in good order.

Full particulars of the material and construction to be submitted for approval.

§ 5. — All trunks, pipes, &c., passing through insulated spaces to be carefully placed, secured, and insulated; and the bilge-suction pipes to have non-return valves.

§ 6. — Thermometer Tube Flanges to be so arranged that water may not enter and be frozen in the tubes.

§ 7. — Cargo battens to be fitted on the sides and bottoms of holds before the cargo to be refrigerated is loaded; those on the sides should be 2 ins. by 1 1/2 ins., and those on the bottom 2 ins. by 2 ins., with a spacing of 9 ins. to 12 ins. apart; one batten over each frame or ground.

§ 8. — Sluice Valves should not be fitted in the bulkheads of cargo holds; but, if fitted, to have non-return valves, and to be always accessible.

§ 9. — Easy examination of all bilges, roses, sluices, &c., to be provided for; and the bottom, sides, and coamings of all hatches, limbers, &c., should be coated with paint or varnish. It is also recommended that the insulation on tunnel tops, under hatches, be

protected from injury by strong battens of hard wood, so secured as to be easily removed, together with portions of the insulation itself, to allow of examination.

§ 10. — Spare gear will be required according to the list on page 147. In addition to the items enumerated, it is recommended to supply also those marked R.

### SURVEYS.

The insulation throughout all the refrigerated spaces to be carefully examined and tested *for dryness* and *fullness* by hammering and boring; and all test holes to be carefully closed up. Special attention is to be paid to those parts where dampness, is liable to accumulate, under decks and all horizontal projections and to the tunnel tops. All limber hatches to be removed, limbers cleared, and suction pipes, roses, sluices, and sounding pipes examined; and watertight doors worked. Where brine may escape to the bilges the cement to be examined at each survey.

It is recommended that the machinery be examined and tested at a home port before the cargo is fully unloaded, but in every case all the working parts of the refrigerating machinery — the pumps, steam and water pipes, tanks, condensers, coolers, coils (and

### REFRIGERATING MACHINERY

their connections), and brine pumps — opened out and examined, and the last four tested it thought necessary.

Auxiliary machinery, if fitted, to be also examined. The machinery to be afterwards tested under working conditions, and the fall of temperature and time noted.

If a further survey be required at a loading port, it will comprise an examination of the insulation and dunnage battens in the refrigerating spaces to see that they have suffered no damage since the survey at home, with a test, under working conditions, of the machinery. When the holds have been properly refrigerated, the machinery to be stopped for at least two hours and a half when brine cooling is employed, and at the end of that period the time and rise of temperature noted.

(\*) These beams when over 32 feet long to consist of a bulb angle.

(\*\*) These beams when over 34 feet long to consist of a bulb angle.

It is assumed that beams of 43 ft and over also those of 55 ft. and over are supported by two and three rows of pillars respectively.

Sections of equivalent strength will be accepted with the approval of the Administration.

In bulb angle bars the sectional area in square inches of the bulb projection beyond the side of the web shall be not less than (.01 D<sup>2</sup> + .2), D being the depth of bar in inches.

In bulb plates and T bulb bars the total sectional area in square inches of the bulb projections beyond the sides of the web shall be not less than (.01 D<sup>2</sup> + .1), D being the depth of bar in inches.

N. B. — The scantlings given in the above Table are to be maintained for half length amidships. At the ends of the vessel a reduction of from 10 % to 15 % will be allowed, with a minimum thickness of  $\frac{8}{32}$  in.

(†) Floorplates to be increased  $\frac{2}{32}$  under boiler bearers and engine seats. (Art. 25, § 5.) In double bottoms constructed with floors on every frame the intercostal side bearers are to be  $\frac{1}{16}$ th of an inch thicker than the floors in cases where only one intercostal is fitted on either side.

(\*) When a flat plate keel is fitted, the centre bearer must be connected to it by two keelson angle bars. (See Tables N° 3.)

NOTE. — For further particulars, see Article 30.

Table N° 11<sup>1</sup> (A). — **MACHINES RECOGNIZED BY THE BUREAU VERITAS FOR TESTING ANCHORS AND CHAINS.**

Vessels supplied with **ANCHORS** and **CHAIN CABLES**, which have been submitted to **Veritas** proofs at one of the following testing machines recognized by the Administration and have been furnished with Veritas test certificates, will be inserted in the *Register* with the marks :

**A. P.** for Anchors. — **C. P.** for Chains. — **A. & C. P.** for Anchors and Chains.

N. B.— In Great Britain the Administration recognizes no other machines for **GROUND TACKLE** but those in Test Houses licensed by the Board of Trade. — The certificates must be stamped and registered at the British Central Office, London, or at the Head Office in Paris. Cast steel anchor heads must be tested by one of the Society's Surveyors who will give a separate certificate for same, which is to be attached to the Anchor test Certificate.

For Anchors and Chains.

\* A reduction of one-third to be allowed on the number as thus found for the anchors and chain cables (not for hawsers) of full powered steamers.

\*\* See Table N° 12<sup>1</sup>. When stockless anchors are used, the tabular weight to be increased by 25 %.

Vessels whose Anchors or chains have been tested at a machine recognized by the Administration of the *Bureau Veritas*, shall be inserted in the Register with the marks : A. P. for Anchors, C. P. for Chains, — A & C. P. for Anchors & Chains.

For the proofs, and for list of recognized machines, see Tables N° 11<sup>1</sup> and 12<sup>1</sup>.

\* A reduction of one-third to be allowed on the number as thus found for the anchors and chain cables (not for hawsers) of full powered steamers.

\*\* See Table No 12<sup>1</sup>. When stockless anchors are used, the tabular weight to be increased by 25 o/o.

Vessels whose anchors or chains have been tested at a machine recognized by the Administration of the *Bureau Veritas*, shall be inserted in the Register with the marks : A. P. for Anchors, — C. P. for Chains, — A & C. P. for Anchors and Chains.

For the proofs and for list of recognized machines, see Tables No 11<sup>1</sup> and 12<sup>1</sup>.

(*) One cap shroud and one topmast cap shroud, same size as corresponding shrouds, to be added when pole masts are used.																											
(**) These chain plates and rigging screws to be used for the main mast lower rigging and topmast backstays. For other parts of the rigging, they are to be in proportion with the size of corresponding shrouds and backstays.																											

## NOTES AND REFERENCES

**A** - A bulb of the size required for second deck beams to be riveted between the angle bars of the lower bilge keelsons, for  $\frac{2}{3}$  the vessel's length amidships.

**A1** - If the vessel's numeral is 225,000 or above, intercostal plates of the thickness required for intercostal side keelsons connected to the plating by an angle bar are to be fitted, for  $\frac{1}{2}$  the vessel's length amidships, in addition to the bulb required by **A**.

**A2** - A vertical plate with two keelson angle bars on its upper edge riveted between the angle bars of the lower bilge keelsons, for  $\frac{2}{3}$  the vessel's length amidships, and intercostal plates connected to the plating by an angle bar for  $\frac{1}{2}$  the vessel's length amidships. The height of the vertical plate to be not less than  $\frac{1}{2}$  the depth of the middle line keelson; its thickness and that of the intercostal plates to be the same as required for intercostal side keelsons. (Table No 3.)

In vessels whose numeral exceeds 750,000 the depth of the vertical plate shall be three fourths that of the middle line keelson, and if the numeral be over 1,000,000 an additional keelson will be required or other equivalent to the satisfaction of the Administration.

**B** A side intercostal keelson according to Art. 17 § 6 to be fitted.

**B1** If the vessel's numeral is 225,000 or above, a bulb of the size required for second deck beams to be riveted between the angles of the intercostal side keelson mentioned in note **B** for  $\frac{1}{2}$  the vessel's length amidships.

**B2** If the vessel's numeral is 225,000 or above, the bulb mentioned in note **B1** must be replaced by a vertical plate with two keelson angle bars on its upper part. The height of this plate to be not less than  $\frac{1}{2}$  the depth of the middle line girder keelson, and its thickness equal to that of the intercostal plates (Table No 3). When the numeral exceeds 900,000 the depth of the vertical plate shall be threefourths\* that of the middle line keelson.

**C** An intercostal plate of the thickness required by Table No 3 to be fitted for  $\frac{2}{3}$  length.

**C1** As in C, but with the addition of a bulb bar of the size required for second deck beams. The bulb to extend for  $\frac{1}{2}$  length and the intercostal for  $\frac{3}{4}$  length amidships.

**C2** As per sketch. The intercostal plate shall have a depth inside the reverse frame of half that of the centre girder keelson as given in Table No 3. It shall extend from the bow aft the one-third length, and right aft in vessels whose numeral exceeds 1,000,000.

**D** This strake (sheerstrake or stringer plate, as per table) to be doubled as follows.

The sheerstrake to be an outside strake doubled between the stringer and the strake adjoining the sheerstrake, by a plate of the same thickness as the strake below it, and of a width not less than 24 inches, for  $\frac{2}{3}$  the vessel's length amidships.

The deck stringer to be doubled for its whole width with a plate of the same thickness as the deck strake next to it, and a double stringer angle bar to be fitted in all cases, as per Art. 18 § 2.

N. B. - In lieu of being doubled, the sheerstrake or stringer plate may be increased by half its tabular thickness.

(1) 2<sup>d</sup> deck in awningdeck and shelterdeck vessels.  
(2) This addition to be divided over two strakes.  
(3) First and second strakes below sheer doubled.  
(4) Upper and main deck stringers doubled.  
(5) One bilge strake doubled.

\* For vessels whose numeral exceeds 750,000, the Administration reserves the right to allow less or demand more additions for extreme proportions; each submitted case will be considered as a special one.

## NOTES AND REFERENCES

**A** — A bulb of the size required for second deck beams to be riveted between the angle bars of the lower bilge keelsons, for  $\frac{2}{3}$  the vessel's length amidships.

**A1** — If the vessel's numeral is 225,000 or above, intercostal plates of the thickness required for intercostal side keelsons connected to the plating by an angle bar are to be fitted, for  $\frac{1}{2}$  the vessel's length amidships, in addition to the bulb required by **A**.

**A2** — A vertical plate with two keelson angle bars on its upper edge riveted between the angle bars of the lower bilge keelsons, for  $\frac{2}{3}$  the vessel's length amidships, and intercostal plates connected to the plating by an angle bar for  $\frac{1}{2}$  the vessel's length amidships. The height of the vertical plate to be not less than  $\frac{1}{2}$  the depth of the middle line keelson; its thickness and that of the intercostal plates to be the same as required for intercostal side keelsons. (Table No 3.)

In vessels whose numeral exceeds 750,000 the depth of the vertical plate shall be three fourths that of the middle line keelson, and if the numeral be over 1,000,000 an additional keelson will be required or other equivalent to the satisfaction of the Administration.

**B** — A side intercostal keelson according to Art. 17 § 6 to be fitted.

**B1** — If the vessel's numeral is 225,000 or above, a bulb of the size required for second deck beams to be riveted between the angles of the intercostal side keelson mentioned in note **B** for  $\frac{1}{2}$  the vessel's length amidships.

**B2** — If the vessel's numeral is 225,000 or above, the bulb mentioned in note **B1** must be replaced by a vertical plate with two keelson angle bars on its upper part. The height of this plate to be not less than  $\frac{1}{2}$  the depth of the middle line girder keelson, and its thickness equal to that of the intercostal plates (Table No 3). When the numeral exceeds 900,000 the depth of the vertical plate shall be threefourths that of the middle line keelson.

**C** — An intercostal plate of the thickness required by Table No 3 to be fitted for  $\frac{2}{3}$  length.

**C1** — As in C, but with the addition of a bulb bar of the size required for second deck beams. The bulb to extend for  $\frac{1}{2}$  length and the intercostal for  $\frac{3}{4}$  length amidships.

**C2** — As per sketch. The intercostal plate shall have a depth inside the reverse frame of half that of the centre girder keelson as given in Table No 3. It shall extend from the bow aft the one-third length, and right aft in vessels whose numeral exceeds 1,000,000.

**D** — This strake (sheerstrake or stringer plate, as per table) to be doubled as follows.

The sheerstrake to be an outside strake doubled between the stringer and the strake adjoining the sheerstrake, by a plate of the same thickness as the strake below it, and of a width not less than 24 inches, for  $\frac{2}{3}$  the vessel's length amidships.

The deck stringer to be doubled for its whole width with a plate of the same thickness as the deck strake next to it, and a double stringer angle bar to be fitted in all cases, as per Art. 18 § 2.

N. B. — In lieu of being doubled, the sheerstrake or stringer plate may be increased by half its tabular thickness.

TABLE 14. — ADDITIONS TO VESSELS OF EXTREME PROPORTION OF LENGTH TO DEPTH.

NUMBERS L × B × D. (Art. 9.)		Under 75000	75000 — 150000	150000 — 300000	300000 — 450000	450000 — 600000	600000 — 750000	750000 — 1000000*	1000000 — 1250000*	1250000 — 1500000*

## ASSIGNMENT OF FREEBOARD.

The BUREAU VERITAS, as an Association for the survey and registry of Shipping, has been appointed by the Board of Trade to approve and certify on their behalf the position of Load Line Discs, for the purpose of the Merchant Shipping Acts 1894.

Forms of application for the assignment of freeboard can be obtained from all Offices of the Society.

### EXTRACT FROM THE REGULATIONS MADE BY THE BOARD OF TRADE, AS TO LOAD-LINE MARKS.

1. The lines to be used in order to indicate the maximum load-line under different circumstances and at different seasons shall be nine inches in length and one inch in thickness, and the maximum load-line shall be the upper edge of each of such lines.

2. The said lines shall be horizontal lines marked on both sides of the ship, extending from and at right angles to a vertical line marked 21 inches forward of the centre of the disc. The maximum load-line in fresh water shall be marked abaft such vertical line, and the maximum load-lines in salt water shall be marked forward of such vertical line, as shown on the diagrams. (See over.)

3. Such maximum load-lines shall be as follows, viz. : —

- For fresh water,
- » Indian summer,
- » summer,
- » winter,
- » winter, North Atlantic,

and shall be distinguished by initial letters permanently and conspicuously marked opposite such horizontal lines as aforesaid, such initial letters being as follows: —

- F.W. — Fresh water.
- I.S. — Indian summer.
- S. — Summer.
- W. — Winter.
- W.N.A. — Winter, North Atlantic.

The upper edge of the horizontal line passing through the centre of the disc shall always indicate the summer freeboard in salt water.

4. Steamships shall be marked with such of the horizontal lines as aforesaid as are applicable to the nature of their employment, and sailing ships shall be marked with such of the above-mentioned lines as indicate the maximum load-line for fresh water and for North Atlantic winter, but sailing ships engaged solely in the coasting trade shall only be marked with the line indicating the maximum load-line in fresh water.

5. The said disc, and the lines or marks to be used in connexion therewith, shall be painted white or yellow on a dark ground, or black on a light ground, and the position of the disc and of each of the lines shall in the case of iron and steel vessels be permanently marked by centre punch marks, and shall in the case of wooden vessels be sunk for their breadths into the planking a depth of not less than one quarter of an inch.

Fees for the survey of and assignment of Freeboards	Classed Vessels and Wooden Sailing vessels not opened out for Survey	UNCLASSED VESSELS

### FREEBOARD

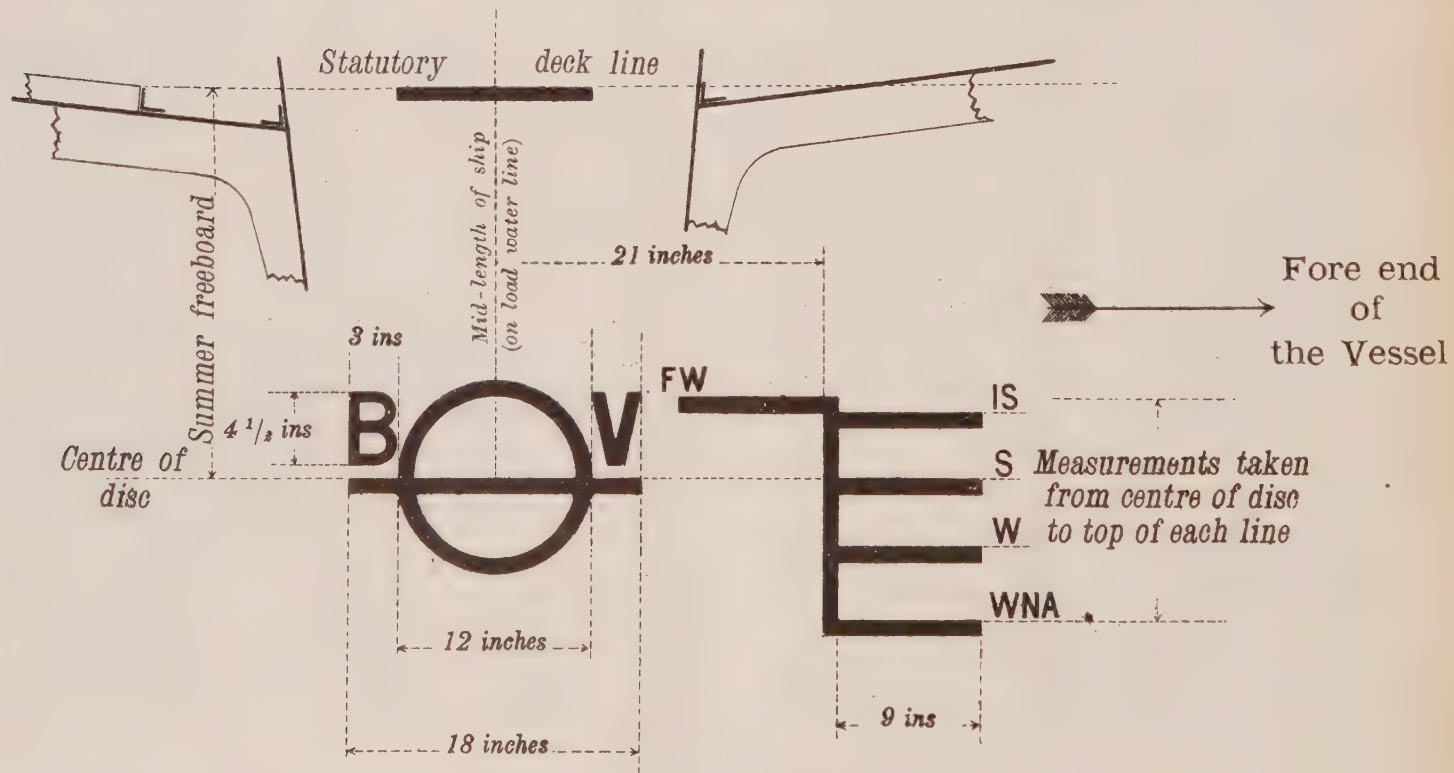

To be added to Scale of fees.

The fee to be charged for a copy of a certificate of approval of load-line is 5 s.

The travelling expenses incurred by surveyors in inspecting vessels for the assignment of load line should be charged to the owners, in addition to the full fee as prescribed above.

When owners or builders submit proposed designs of vessels and require provisional assignment of freeboard, the full fee as prescribed above should be paid, which will cover the final assignment when required to be made.

KEY TO THE REGISTER — ERKLÄRUNG DER ABKÜRZUNGEN

# NOTE EXPLICATIVE

## NAVIRES A VOILES

### PREMIÈRE COLONNE.

La ✠ indique que le navire a été construit sous la surveillance spéciale et continue des Experts de l'Administration. (Voir Article 5, § 4 du Règlement.)

### 2<sup>e</sup> COLONNE.

Numéro d'ordre auquel correspondent les changements des Suppléments.

### 3<sup>e</sup> COLONNE.

#### NOMS DES NAVIRES & DES CAPITAINES.

#### DATE DU TERME

Les navires se trouvent classés dans le Registre suivant l'ordre alphabétique de leur nom et de leur pavillon, et l'importance de leur tonnage.

Lorsque le nom d'un navire se compose de plusieurs mots, le chercher à la lettre initiale du premier mot.

Ainsi : *Albert-Renée* se trouve à la lettre A; *John-Bull* au J; *Weser-Zeitung* au W, et ainsi de suite.

Les nombres placés sous le nom du capitaine indiquent : le premier, l'année où il a été breveté; le second, celle où il a pris le commandement de son navire.

Les chiffres à la suite des lettres P.C. indiquent la pression en kilogrammes et en livres de la petite chaudière ainsi que la date de la dernière visite.

Clayton. Ce mot sous le nom du navire signifie qu'il est muni d'un appareil Clayton pour la désinfection et l'extinction des incendies.

ELECTR. Indique que le navire est éclairé à la lumière électrique.

Moteur aux. Indique que le navire est pourvu d'une machine automobile destinée à actionner l'hélice.

Les chiffres entre parenthèses indiquent la date à partir de laquelle commence à courir la classification accordée.

### CLASSIFICATION.

Pour l'intelligence des renseignements et marques indiqués dans les 4<sup>e</sup>, 5<sup>e</sup> et 6<sup>e</sup> colonnes du Registre, il faut consulter le Règlement pour les navires en bois et celui pour les navires en fer publiés en tête du Registre. Ces Règlements déterminent toutes les conditions de la classification et de la construction.

### 4<sup>e</sup> COLONNE.

**1<sup>o</sup> Navires en bois.** — Les chiffres placés dans cette colonne indiquent, le 1<sup>er</sup> la division à laquelle appartient le navire, le 2<sup>me</sup> le terme de durée assigné à la cote indiquée dans la colonne suivante.

La division est exprimée par un nombre compris entre 3 et 16, représentant la catégorie à laquelle appartient la construction conformément aux articles 7, 20 et suivants, et aux Tableaux placés à la fin du Règlement pour les navires en bois. Le terme est fixé conformément aux prescriptions des articles 9 à 18 inclusivement.

Lorsqu'il n'y a qu'un nombre dans la 4<sup>e</sup> colonne, il indique la division à laquelle le navire appartient par sa construction primitive. Ce cas ne peut exister que pour les navires cotés 3/3 et dont la construction remonte à un nombre d'années inférieur à celui qu'indique la division.

S'il y a deux nombres, celui de gauche indique la division à laquelle le navire appartient; celui de droite indique le terme de durée assigné à la cote, à compter de la date inscrite entre parenthèses dans la 3<sup>me</sup> colonne.

Ainsi :

16-4 signifie division 16 ans classé pour 4 ans.

7-5                      »                      7                      »                      5                      »

Dans les Suppléments le mot « voyage » remplaçant les nombres indique que la cote n'a été confirmée que pour la durée d'un voyage déterminé.

**2<sup>o</sup> Navires en fer et en acier.** — La classification des navires en fer et en acier est exprimée par les marques suivantes :

I, (I), (I) 3/3, signifie : 1<sup>re</sup> division

II, (II), (II) 3/3,                      »                      2<sup>e</sup>                      »

III, (III), (III) 3/3,                      »                      3<sup>e</sup>                      »

Les divisions sont données conformément aux prescriptions des articles 2, 9 et suivants du règlement pour les navires en fer.

Les navires mixtes (fer et bois) ont leur classification exprimée par les marques suivantes :

(I)  $\frac{3}{3}$ , (II)  $\frac{3}{3}$ , (III)  $\frac{3}{3}$ .

P. R. signifie que l'Avant a reçu des renforts en vue de naviguer dans les glaces.

### 5<sup>e</sup> et 6<sup>e</sup> COLONNES.

#### COTES ET MARQUES DE NAVIGATION.

Les fractions inscrites dans la 5<sup>e</sup> colonne expriment la confiance dont les navires ont été jugés dignes d'après les rapports des experts;  $\frac{3}{3}$  est la cote des navires excellents;  $\frac{3}{4}$  est la cote des navires médiocres.

Pour les navires en fer, cette cote s'applique exclusivement aux parties en bois de la construction, au gréement et aux dépendances, la valeur de la coque métallique étant représentée par la division à laquelle elle appartient.

La cote proprement dite est toujours accompagnée de 2 chiffres placés dans la 6<sup>e</sup> colonne et qui indiquent séparément : celui de gauche, les qualités du *corps* ; celui de droite, celles du gréement et autres dépendances. Ces chiffres varient de 1 à 3; le chiffre 1 s'applique aux coques et aux dépendances en très bon état; 2 et 3 indiquent que l'état d'entretien laisse plus ou moins à désirer.

En résumé, les diverses cotes que peut obtenir un navire sont représentées de la façon suivante :

$\frac{3}{3}$ , 1. 1.

$\frac{3}{6}$ , 1. 1.

$\frac{3}{6}$ , 2. 1.

$\frac{3}{4}$ , 2. 1.

$\frac{2}{3}$ , 3. 2.

$\frac{1}{2}$ , 3. 2.

La cote est supprimée et remplacée par des traits (— —) dans les conditions suivantes:

1<sup>o</sup> Après l'expiration de la période de durée assignée à la cote, ainsi que dans les cas prévus par l'article 6 du Règlement pour navires en bois, et l'art. 6 du Règlement pour navires en fer.

2<sup>o</sup> Aux navires non visités d'une manière complète.

Les points ( . . . . ) mis à la place de la cote, tandis que la classification entre parenthèses est reportée dans la 3<sup>e</sup> colonne, indiquent que le navire n'a pas été soumis à une des visites réglementaires prescrites par l'article 6; ou bien que des réparations jugées nécessaires par l'expert n'ont pas été exécutées.

Les *lettres de navigation* placées à droite indiquent la navigation à laquelle le navire est propre.

A. signifie : *Atlantique*, ou navigation des côtes orientales des deux Amériques et des côtes occidentales de l'Afrique ou navigation intermédiaire dans les mers des Indes et du Pacifique.

G. signifie : *Grand Cabotage*, ou navigation entre les ports de France sur la Manche et l'Océan et ceux des mers Glaciale et Baltique; des côtes d'Espagne et de Portugal; des Açores, des Canaries, de la mer Méditerranée, du Golfe de Venise, de l'Archipel et de la mer Noire, etc.

I. signifie : *Intérieur*, c'est-à-dire que le navire ne mérite la confiance désignée que pour la navigation des fleuves et des rivières.

L. signifie : *Long Cours*, ou navigation au delà des caps Horn et de Bonne-Espérance.

Lakes, signifie : navigation des grands lacs Américains ou Mers intérieures.

M. signifie : *Méditerranée*, ou navigation spéciale de la Méditerranée.

P. signifie : *Petit Cabotage*, ou navigation entre des points peu éloignés, par exemple : de Bordeaux à Rouen; de Marseille à Gibraltar; d'Amsterdam à Christiania, etc.

R. signifie : *Service des rades et des ports*.

R — s'applique aux Yachts de course.

Y. désigne : navigation de plaisance.

A. P. } signifie que les ancres (A.P.), ou les chaînes (C.P.), ou les  
C. P. } ancres et les chaînes (A.&C.P.), ont été soumises aux épreuves  
A. & C. P. } exigées à une des machines reconnues par le *Bureau Veritas*.

7<sup>e</sup> COLONNE.

GRÉEMENT.

Alg	— Allège.	Jgt	— Jagt.
B-G	— Brick-Goëlette.	Kff	— Koff.
Barge	— Chaland.	Kn	— Kahn.
Bk	— Brick.	Kt	— Ketch.
Bmb	— Bombarde.	Lg	— Lougre.
Bq	— Barque.	Plc	— Polacre.
Bsq	— Bisquine.	Slp	— Sloop, chaloupe.
Chal	— Chaland.	Sk	— Smack.
Ch-M	— Chasse-Marée.	Sng	— Snigg.
Ctt	— Cutter.	Ttn	— Tartane.
Dg	— Dogger.	Tk	— Tjalk.
Dy	— Dandy.	1m	— à un mât.
Ev	— Ever.	3m	— Trois-Mâts carrés.
G 3m	— Goëlette à 3 mâts.	4m	— Quatre-Mâts.
G 4m	— Goëlette à 4 mâts.		
Glo	— Galiote.		
Gls	— Galéasse.		
Glt	— Goëlette.	dv	— avec dérives.
Hr	— Hourie.	bsc	— mâts à bascule.

Signes additionnels.

Le nombre des ponts est indiqué au-dessous du gréement :

- 1 P-B — Un pont bordé avec barres sèches.
- 1 P+Bp — Un pont bordé & barres-sèches pourvues d'une partie de faux-pont en abord.
- 2 P — Deux ponts bordés.
- 2 P-S — Deux ponts bordés, dont un spardeck.
- 2 P-B — Deux ponts bordés avec barres sèches.
- 2 P-H — Deux ponts bordés, dont un awningdeck.
- 2 P-B-S — Deux ponts bordés, dont un spardeck et barres sèches.
- 3 P — Trois ponts bordés.
- 3 P-S — Trois ponts bordés, dont un spardeck.

Lorsqu'il n'y a rien sous le gréement, c'est que le navire n'a qu'un seul pont.

*Awningdeck ou Hurricanedeck* (Pont-abri). Navire dont le pont principal est surmonté d'un pont léger.

*Shadedeck*. Pont-tente.

*Spardeck*. Navire dont l'entrepont supérieur est affecté au logement de l'équipage et des passagers et aux marchandises légères, dites d'encombrement.

*Welldeck*. Navire à coffre.

8<sup>e</sup> COLONNE.

Les 3 tonnages inscrits indiquent respectivement : 1<sup>o</sup> le tonnage total, toutes constructions comprises ; 2<sup>o</sup> le tonnage net ou de douane ; 3<sup>o</sup> le tonnage total sous le pont supérieur. Lorsqu'il n'y a qu'un seul nombre, celui-ci indique le tonnage net.

9<sup>e</sup> COLONNE.

PAVILLONS.

Alm	— Allemand.	Grc	— Grec.
Amr	— Américain.	Hait	— Haïtien.
Ang	— Anglais.	Itl	— Italien.
Arg	— Rép. Argentine.	Jap	— Japonais.
Aut	— Autrichien.	Mtn	— Monténégrin.
Blg	— Belge.	Mxc	— Mexicain.
Blv	— Bolivien.	Nic	— Nicaragua.
Brs	— Brésilien.	Nrw	— Norvégien.
Bul	— Bulgare.	P.B	— Hollandais.
C-R	— Costa-Rica.	Prs	— Perse.
Chl	— Chilien.	Prv	— Péruvien.
Chn	— Chinois.	Ptg	— Portugais.
Col	— Colombien.	Rmn	— Roumain.
Cub	— Cuba.	Rss	— Russe.
Dan	— Danois.	Sds	— Suédois.
Dmn	— St-Domingue.	Tns	— Tunisien.
Ecd	— Equateur.	Tre	— Turc.
Egp	— Egyptien.	Urg	— Uruguay.
Esp	— Espagnol.	Vnz	— Vénézuélien.
Frç	— Français.	Zzb	— Zanzibar.

10<sup>e</sup> COLONNE.

Année de la construction . . 91, . . 05, . . signifient : 1891, . . 1905.

Pour les navires en bois, l'indication O.98, O.05, etc., placée sous les chiffres de l'année de construction signifie que le navire a été ouvert en telle année.

Pour les navires en fer et en acier, l'indication V.98, V.05, etc., indique que le navire a été soumis à la visite de l'article 6 du règlement en telle année; dans ce cas, la date de classification reprendra cours à partir de cette époque. Les marques III<sup>1</sup>, III<sup>2</sup> ou III<sup>3</sup> signifient que le navire a passé pour la première, la deuxième ou la troisième fois la visite de 12 ans prescrite par l'article 6 du Règlement.

#### 11<sup>e</sup> COLONNE.

PORT DE CONSTRUCTION; NOM DU CONSTRUCTEUR.

#### 12<sup>e</sup> COLONNE.

MATÉRIAUX EMPLOYÉS DANS LA CONSTRUCTION.

A.	— Acier.	Hk.	— Hackmatack.
Ac.	— Acacia.	Hml.	— Hemlock.
Acj.	— Acajou.	Ml.	— Mélèze.
B.	— Bouleau.	Mr.	— Merisier.
B.d.F.	— Bois de fer.	Nr.	— Noyer.
C.	— Chêne.	Ol.	— Olivier.
Cd.	— Cèdre.	Or.	— Orme.
Ch.	— Châtaignier.	P.	— Pin.
Cp.	— Cypres.	PP.	— Pitchpine.
Er.	— Erable.	S.	— Sapin.
F.	— Fer.	Sp.	— Spruce.
Gr.	— Greenheart.	T.	— Teck.
Ht.	— Hêtre.		

CONSTRUCTION, CHEVILLAGE, DOUBLAGE, RÉPARATIONS, ETC.

grp. rc. ou SS. — signifient que le navire a reçu une grande réparation, ou reconstruction, ou une visite complète *sous la surveillance spéciale* des Experts de l'Administration, conformément aux articles 12, 13 et 15 du Règlement.

à cl.	— bordage à clin.	n.	— neuf.
alg.	— allongé.	p.	— pont.
b.	— bois.	pr.ch.fr.	— préceintes chevillées fer.
car.	— caréné. Pour les navires en fer : carène peinte.	q.ch.fr.	— quille chevillée fer.
ch.	— chevillé.	rc.	— reconstruit.
cv.	— cuivre.	rp.	— réparations.
d.	— doublé.	S.A.	— sans archipompe.
d.g.	— doublage galvanique.	S.C.	— » courbes
exh.	— exhaussé.	S.V.	— » vaigrage.
fd-plt	— fond plat.	s.	— supérieur.
fr.	— fer.	sal.	— salaison.
frg.	— fer galvanisé.	sfb.	— sur franc-bord.
fl.	— feutre.	WB.	— waterballast.
G-E.	— grandes écoutilles.	z.	— zinc.
grp.	— grande réparation.	1/2 V.	— vaigrage à mi-hauteur de calc.
m.	— métal ou cuivre jaune.		

*Center-Board* : dérive centrale. — *Sff.* : soufflage en bois de la carène. — *Sff. pr.* : soufflage en bois des préceintes.

.....97.....05, signifient 1897..... 1905.

*Awningd., Hurric., Shaded., Spard., Welld.,* voir 7<sup>e</sup> colonne.

#### 13<sup>e</sup>, 14<sup>e</sup> & 15<sup>e</sup> COLONNES.

DIMENSIONS PRINCIPALES.

*Longueur et largeur* exprimées en mètres et centimètres, et en pieds et pouces anglais, et autant que possible d'après les *mesures officielles de douane de chaque pays.*

1 mètre = 3 pieds 3 <sup>3</sup>/<sub>8</sub> pouces anglais.

#### 16<sup>e</sup> COLONNE.

*Franc-bord* mesuré à partir de la ligne de pont réglementaire : 1<sup>er</sup> chiffre pour toutes saisons en eau salée, 2<sup>e</sup> chiffre (H. A. N.) : navigation d'hiver dans l'Atlantique Nord, en pouces anglais.

Les chiffres entre [ ] indiquent que le franc-bord à notre connaissance n'est pas marqué sur le navire.

Le signe **==** indique que le franc-bord est annulé par suite de perte ou de modification de la cote.

#### 17<sup>e</sup> COLONNE.

PORT D'ARMEMENT.

#### 18<sup>e</sup> COLONNE.

NOM DE L'ARMATEUR ET RÉSIDENCE.

## NAVIRES A VAPEUR

### PREMIÈRE COLONNE.

La  indique que le navire a été construit sous la surveillance spéciale et continue des Experts de l'Administration. (Voir Article 5, § 4 du Règlement.)

### 2<sup>e</sup> COLONNE.

Numéro d'ordre auquel correspondent les changements des Suppléments.

### 3<sup>e</sup> COLONNE.

NOMS DES NAVIRES & DES CAPITAINES.

DATE DU TERME.

Les navires se trouvent classés dans le Registre suivant l'ordre alphabétique de leur nom et de leur pavillon, et l'importance de leur tonnage.

Lorsque le nom d'un navire se compose de plusieurs mots, le chercher à la lettre initiale du premier mot.

Ainsi : *A.-Wicander* se trouve à la lettre A; *La-Touraine* à la lettre L; *W.-G.-Hall* au W, et ainsi de suite.

Les nombres placés sous le nom du capitaine indiquent : le premier, l'année où il a été breveté; le second, celle où il a pris le commandement de son navire.

*ELECTR.* Signifie que le navire est éclairé à la lumière électrique.

*CLAYTON APP.* signifie que le vapeur est muni d'un appareil « Clayton » pour la désinfection et l'extinction des incendies.

*Cable ship, Hopper, Hopper-dredger, Ice-Breaker, Railway-Ferry, Sand-pump-dredger, Trawler, Whaleback,* désignent : Vapeur à câbles, porteur, drague-porteuse, brise-glace, bac, drague-aspiratrice, chalutier, à dos de baleine. — *Oil in bulk* : Huile en vrac. — *Pétrol. in bulk* : Pétrole en vrac.

Les chiffres entre parenthèses indiquent la date à partir de laquelle commence à courir la classification accordée.

### CLASSIFICATION

Pour l'intelligence des renseignements et marques indiquées dans les 4<sup>e</sup>, 5<sup>e</sup> et 6<sup>e</sup> colonnes du Registre, il faut consulter le Règlement pour les navires en bois et celui pour les navires en fer publiés en tête du Registre. Ces Règlements déterminent toutes les conditions de la classification et de la construction.

### 4<sup>e</sup> COLONNE.

**1<sup>o</sup> Navires en fer et en acier.** — La classification des navires en fer ou en acier est exprimée par les marques suivantes :

**I,**    ,     3/3, signifie : 1<sup>re</sup> division.  
**II,**    ,     3/3,    »    2<sup>e</sup>    »  
**III,**    ,     3/3,    »    3<sup>e</sup>    »

Les divisions sont données conformément aux prescriptions des articles 2, 9 et suivants du règlement pour les navires en fer.

Les navires mixtes (fer et bois) ont leur classification exprimée par les marques suivantes :

 3/3,  3/3,  3/3.

*P.R.* Signifie que l'Avant a reçu des renforts en vue de naviguer dans les glaces.

**2<sup>o</sup> Navires en bois.** — Les chiffres placés dans cette colonne indiquent la division à laquelle appartient le navire et le terme de durée assigné à la cote indiquée dans la colonne suivante.

La division est exprimée par un nombre compris entre 3 et 16, représentant la catégorie à laquelle appartient la construction conformément aux articles 7, 20 et suivants, et aux Tableaux placés à la fin du Règlement pour les navires en bois. Le terme est fixé conformément aux prescriptions des articles 9 à 18 inclusivement.

Lorsqu'il n'y a qu'un nombre dans la 4<sup>e</sup> colonne, il indique la division à laquelle le navire appartient par sa construction primitive. Ce cas ne peut exister que pour les navires cotés 3/3 et dont la construc-

tion remonte à un nombre d'années inférieur à celui qu'indique la division.

S'il y a deux nombres, celui de gauche indique la division à laquelle le navire appartient; celui de droite indique le terme de durée assigné à la cote, à compter de la date inscrite entre parenthèses dans la 3<sup>e</sup> colonne.

Ainsi :

16-4 signifie division 16 ans, classé pour 4 ans ;

7-3 » 7 » 3 »

Dans les Suppléments le mot « voyage » remplaçant les nombres, indique que la cote n'a été confirmée que pour la durée d'un voyage déterminé.

#### 5<sup>e</sup> et 6<sup>e</sup> COLONNES.

#### COTES ET MARQUES DE NAVIGATION.

Les fractions inscrites dans la 5<sup>e</sup> colonne expriment la confiance dont les navires ont été jugés dignes d'après les rapports des experts; 3/3 est la cote des navires excellents; 3/4 est la cote des navires médiocres.

Pour les navires en fer, cette note s'applique exclusivement aux parties en bois de la construction, au grèement et aux dépendances, la valeur de la coque métallique étant représentée par la division à laquelle elle appartient.

La cote proprement dite est toujours accompagnée de 2 chiffres placés dans la 6<sup>e</sup> colonne et qui indiquent séparément : celui de gauche les qualités du *corps*; celui de droite, celles du grèement et autres dépendances. Ces chiffres varient de 1 à 3; le chiffre 1 s'applique aux coques et aux dépendances en très bon état; 2 et 3 indiquent que l'état d'entretien laisse plus ou moins à désirer.

En résumé, les diverses cotes que peut obtenir un navire sont représentées de la façon suivante :

3/3, 1. 1.

3/6, 1. 1.

3/6, \* 2. 1.

3/4, 2. 1.

2/3, 3. 2.

1/2, 3. 2.

La cote est supprimée et remplacée par des traits (— —) dans les conditions suivantes :

1<sup>o</sup> Après l'expiration de la période de durée assignée à la cote, ainsi que dans les cas prévus par l'article 6 du Règlement pour navires en bois, et l'art. 6 du Règlement pour navires en fer.

2<sup>o</sup> Aux navires non visités d'une manière complète.

Les points (....) mis à la place de la cote, tandis que la classification entre parenthèses est reportée dans la 3<sup>e</sup> colonne, indiquent que le navire n'a pas été soumis à une des visites réglementaires prescrites par les articles 6 et 10; ou bien que des réparations jugées nécessaires par l'expert n'ont pas été exécutées.

Les lettres de navigation placées à droite indiquent la navigation à laquelle le navire est propre.

A. signifie : *Atlantique*, ou navigation des côtes orientales des deux Amériques et des côtes occidentales de l'Afrique ou navigation intermédiaire dans les mers des Indes et du Pacifique.

G. signifie : *Grand Cabotage*, ou navigation entre les ports de France sur la Manche et l'Océan et ceux des mers Glaciale et Baltique; des côtes d'Espagne et de Portugal; des Açores, des Canaries, de la mer Méditerranée, du Golfe de Venise, de l'Archipel et de la mer Noire, etc.

I. signifie : *Intérieur*, c'est-à-dire que le navire ne mérite la confiance désignée que pour la navigation des fleuves et des rivières.

L. signifie : *Long Cours*, ou navigation au delà des caps Horn et de Bonne-Espérance.

Lakes signifie : navigation des grands lacs américains ou mers intérieures.

M. signifie : *Méditerranée*, ou navigation spéciale de la Méditerranée.

P. signifie : *Petit Cabotage*, ou navigation entre des points peu éloignés, par exemple : de Bordeaux à Rouen; de Marseille à Gibraltar; d'Amsterdam à Christiania, etc.

R. signifie : *Service des rades et des ports*.

Y. signifie : navigation de plaisance.

A. P. { signifie que les ancrés, ou les chaînes, ou les ancrés et  
C. P. { les chaînes ont été soumises aux épreuves exigées à  
A. & C. P. { une des machines reconnues par le *Bureau Veritas*.

# 7<sup>e</sup> COLONNE.

## GRÉEMENT.

B-G — Brick-Goëlette.	Glt — Goëlette.
Bk — Brick.	Jgt — Jagt.
Bq — Barque.	Kn — Kahn.
Ctt — Cutter.	Kt — Ketch.
Dy — Dandy.	Lg — Lougre.
G 3m — Goëlette 3 m.	Slp — Sloop, chaloupe.
G 4m — Goëlette 4 m.	Tk — Tjalk.
Glo — Galiote	m — Mat.
Gls — Galéasse.	

Le nombre des ponts est indiqué au-dessous du gréement.

- 1 P-B — Un pont bordé avec barres sèches.
- 2 P — Deux ponts bordés.
- 2 P-A — Deux ponts bordés, dont un shadedeck (pont-tente).
- 2 P-B — Deux ponts bordés avec barres sèches.
- 2 P-H — Deux ponts bordés, dont un hurricanedeck ou awning-deck.
- 2 P-S — Deux ponts bordés, dont un spardeck.
- 2 P-B-S — Deux ponts bordés, dont un spardeck et barres sèches.
- 3 P — Trois ponts bordés.
- 3 P-S — Trois ponts bordés, dont un spardeck.

Lorsqu'il n'y a rien sous le gréement, c'est que le navire n'a qu'un seul pont.

*Awningdeck* ou *Hurricanedeck* (Pont-abri). Navire dont le pont principal est surmonté d'un pont léger.

*Shadedeck* (Pont-tente). Navire dont le pont principal est surmonté d'un pont léger, complètement ou en partie ouvert aux côtés.

*Spardeck*. Navire dont l'entrepont supérieur est affecté au logement de l'équipage et des passagers et aux marchandises légères, dites d'encombrement.

*Welldeck*. Navire à coffre.

# 8<sup>e</sup> COLONNE.

Tonnage d'après la jauge de douane du pavillon.

Les 3 tonnages inscrits indiquent respectivement : 1<sup>o</sup> le tonnage total, toutes constructions comprises; 2<sup>o</sup> le tonnage net; 3<sup>o</sup> le tonnage total sous le pont supérieur. Lorsqu'il n'y a qu'un seul nombre, celui-ci indique le tonnage net.

# 9<sup>e</sup> COLONNE.

## PAVILLONS.

Alm — Allemand.	Haw — Hawaïen.
Amr — Américain.	Itl — Italien.
Ang — Anglais.	Jap — Japonais.

# KEY TO THE REGISTER

## SAILING VESSELS

### FIRST COLUMN.

✠ The mark is applied to vessels built under special survey Art. 5, § 4 of the Rules.)

### 2<sup>d</sup> COLUMN.

The rotation number, to which the alterations in the Supplements correspond.

### 3<sup>rd</sup> COLUMN.

#### VESSEL'S AND CAPTAIN'S NAMES.

#### DATE OF TERM.

The vessels are inserted in the Book not only in the alphabetical order of their name, but also of their Flag and according to the importance of their tonnage.

Vessels having a compound name will be found in the Register by looking for the first word, viz : —

*Albert-Rénée*, see letter A; *John-Bull*, see letter J; *Weser-Zeitung*, see letter W.

The figures following the captain's name indicate : 1° the year in which he obtained his certificate; 2° the year in which he was appointed to his present command.

The figures following the letters P.C. indicate the pressure of donkey-boiler in kilogrammes per square centimeter and in pounds per square inch, also the date of last survey.

Clayton App. indicates that the vessel is provided with « Clayton » fire extinguishing and disinfecting machines.

*Moteur aux.* Indicates that the vessel is provided with a motor engine to put the screw in motion.

*ELECTR.* Indicates that the vessel is lighted by electricity.

The figures placed in brackets indicate the date from which the classification granted begins to run.

### CLASSIFICATION

Reference must be made to the Rules for the classification of wooden and iron vessels, given at the beginning of the Register, in order to better understand the informations and the signs given in the 4<sup>th</sup>, 5<sup>th</sup> and 6<sup>th</sup> columns. These Rules contain full particulars for the classification and for the construction of vessels.

### 4<sup>th</sup> COLUMN.

**1° Wooden Vessels.** — The figures in this column indicate the division assigned to the vessel and the term of years assigned to the character given in the following column.

The division is expressed by a number included from 3 to 16 and represents the category which the vessel belongs to according to articles 7, 20 and following, and to the Tables at the end of the present Rules for wooden vessels. The term is granted in conformity with the prescriptions of articles 9 to 18 inclusively.

When there is only one figure in the 4<sup>th</sup> column, it indicates the division for which the vessel has been classed by her original construction. This can only exist for vessels classed 3/3 and whose building dates from a number of years inferior to that indicated by the division.

When there are two figures, the first shows the division assigned to the vessel, the second expresses the duration given to the character, which accounts from the date entered between brackets in the 3<sup>d</sup> column.

Thus :

16-4 signifies : division 16 years, classed for 4 years;

7-5 » » 7 » » 5 »

When, in the Supplements, the word « voyage » replaces this figures, it means that the class has only been confirmed for the time of an indicated voyage.

**2° Iron and steel vessels.** — The classification of iron and steel vessels is expressed as follows :

I, ,  3/3, signifies: 1<sup>st</sup> division.

II, ,  3/3, » 2<sup>d</sup> »

III, ,  3/3, » 3<sup>d</sup> »

The divisions are granted according to the prescriptions of the articles 2, 9 and following of the rules for iron vessels.

The classification of composite vessels (iron and wood) is expressed as follows :

$\textcircled{\text{I}}$   $\frac{3}{3}$ ,  $\textcircled{\text{II}}$   $\frac{3}{3}$ ,  $\textcircled{\text{III}}$   $\frac{3}{3}$ .

P. R. means that the bow has been strenghtened in view of navigation through ice.

#### 5<sup>e</sup> & 6<sup>e</sup> COLUMNS.

#### CHARACTERS AND NAVIGATION MARKS.

The fractions inserted in the 5th column express the confidence deserved by the vessels in conformity with the reports of the Surveyors;  $\frac{3}{3}$  is the character of first class vessels;  $\frac{3}{4}$  the character of inferior vessels.

For iron vessels, the character applies especially to their wooden parts, their rigging and outfit; the qualities of the hulls being represented by the division to which the vessels belong to.

The character is always followed by two figures placed in the 6th column, and which indicate separately: the one on the left, the qualities of the hull; the one on the right, those of the rigging and outfit. These figures vary from 1 to 3; the figure 1 applies to hulls and outfit of first class vessels; 2 and 3 indicate that their state is in a more or less inferior condition.

In fact, the different characters obtainable by a vessel are as follows :

$\frac{3}{3}$ , 1. 1.  
 $\frac{3}{6}$ , 1. 1.  
 $\frac{3}{6}$ , 2. 1.  
 $\frac{3}{4}$ , 2. 1.  
 $\frac{2}{3}$ , 3. 2.  
 $\frac{1}{2}$ , 3. 2.

The character is expunged and replaced by Marks (— —) :

1<sup>o</sup> When the class has expired or when the vessel deserves no longer her class in conformity with the Rules, article 6 for wooden vessels and article 6 for iron vessels.

2<sup>o</sup> In case of incomplete surveys.

The dots (....) instead of the character, with the latter in brackets reported in the 3<sup>rd</sup> column, show that the vessel has not been submitted to one of the surveys required by Art. 6 and 10, or that she has not received the repairs indicated by the Surveyor.

The letters, placed to the right of the figures, indicate the voyages for which the vessel is considered fit :

A. (*Atlantic.*) Voyages to the East Coast of North and South-America and West Coast of Africa and navigation in the Indian & Pacific Oceans.

G. (*Great Coasting trade.*) Voyages to the White Sea, Baltic, Coast of Spain and Portugal, Azores, Canaries, Mediterranean, Gulf of Venice, Archipelago, and Black Sea, etc.

I. *Interior*, denotes that the vessel deserves her Character for inland navigation only.

L. (*Long voyages.*) Voyages beyond Cape Horn and Cape of Good Hope. Lakes. Navigation on the great Lakes or inland seas.

M. Special navigation in the *Mediterranean*.

P. (*Small Coasting trade.*) Voyages between ports not far from each other, viz : from Bordeaux to Rouen; from Marseilles to Gibraltar; from Amsterdam to Christiania.

R. *Port and Roadstead purposes.*

R — applies to racing-Yachts.

Y. Yachting.

A. P. } denotes that the anchors, (A. P.) or chains (C. P.),  
 C. P. } or anchors and chains (A. & C. P.), have been tested at  
 A. & C. P. } a machine recognized by the *Bureau Veritas*.

*Cote prévue* = *Class contemplated*.

7<sup>th</sup> COLUMN

RIGGING.

Alg	—	Lighter.	Kff	—	Kuff.
Bk	—	Brig.	Kn	—	Kahn.
Bk-Glt	—	Brigantine.	Kt	—	Ketch.
Bq	—	Bark.	Lg	—	Lugger.
Bq-Glt	—	Barkentine	Ple	—	Polacca.
Bsq	—	Bisquine.	Slp	—	Sloop.
Chal	—	Barge	Sk	—	Smack.
Ch.M	—	Chasse-Marée.	Sug	—	Snigg.
Ctt	—	Cutter.	Ttn	—	Tartana.
Dg	—	Dogger.	Tk	—	Tjalk.
Dy	—	Dandy.	1 m	—	1 mast.
Ev	—	Ever.	3 m	—	Ship.
G	—	Schooner.	4 m	—	4 Masts.
Glo	—	Galliot.			
Gls	—	Galeas.			
Glt	—	Schooner.			
Hr	—	Houri.			
Jgt	—	Yacht.			

Additional signs

dv	—	with lee-boards.
bsc	—	plying masts.

The number of decks is shown below the rigging.

- 1 P-B denotes: single deck with orlop beams.
- 1 P + Bp » single deck with orlop beams & partial tweendecks
- 2 P » two decks.
- 2 P-S » two decks — spardecked vessel.
- 2 P-B » two decks with orlop beams.
- 2 P-H » two decks — awning-deck.
- 2 P-B-S » two decks — spardecked vessel with orlop beam.
- 3 P » three decks.
- 3 P-S » three decks — spardecked vessel.

Vessels without any marks under the rigging have a single deck.

*Awningdeck or Hurricanedeck.* Vessels where the main deck is covered with a light deck.

*Shadedeck.* — Vessels where the main deck is covered with a light deck wholly or partly open at sides.

*Spardeck.* Vessels where the space under the upper deck is used solely for the accommodation of the crew and passengers, and for the stowage of light goods such as are termed measurement goods.

*Welldeck.* Vessels having a forecastle and a longraised quarter-deck, or a poop joined to a bridgehouse.

8<sup>th</sup> COLUMN.

TONNAGE AND DECKS.

The 3 numbers indicate respectively : 1<sup>o</sup> the gross tonnage (all erections on deck included; 2<sup>o</sup> the nett or Register tonnage; 3<sup>o</sup> the tonnage under the upper deck (without any deduction).

When only one tonnage is indicated, it is the nett tonnage.

9<sup>th</sup> COLUMN.

FLAGS.

Alm	—	German.	Gre	—	Greek.

10th COLUMN

Year when the vessel was built

.. 93, ..05, denote: .. 1893, ..1905.

For wooden vessels O. denotes that the vessel was opened, thus :  
O.93, O.05, opened in 1893, 1905.

For iron vessels, V. denotes that the vessel was submitted to  
survey article 6 of the Rules, thus : V.05, surveyed in 1905. In this  
case, the date of Classification will take course from the date of  
this survey.

The marks III<sup>1</sup>, III<sup>2</sup>, III<sup>3</sup> indicate that the vessel has been sub-  
mitted for the first, second or third time to the 12 years' survey  
required by article 6 of the rules.

The figures following these abbreviations indicate the month and year of last survey.

The letters C. V. with a date indicate that the caulking of the bottom has been tested at that date.

## STEAMERS

### FIRST COLUMN.

✚ The mark is applied to vessels built under special survey.  
(Art. 5, § 4 of the Rules.)

### 2nd COLUMN.

The rotation number, to which the alterations in the Supplements correspond.

### 3rd COLUMN.

VESSEL'S AND CAPTAIN'S NAMES.

DATE OF TERM.

The vessels are inserted in the Book not only in the alphabetical order of their name, but also of their flag and according to importance of their tonnage.

Vessels having a compound name will be found in the Register by looking for the first word, viz : —

*A.-Wicander*, see letter A; *La-Touraine*, see letter L; *W.-G-Hall*, see letter W.

The figures under the captain's name indicate : 1<sup>o</sup> the year in which he obtained his certificate; 2<sup>o</sup> the year in which he was appointed to his present command.

*ELECTR.* indicates that the vessel is lighted by electricity.

*CLAYTON APP.* means that the steamer is provided with « Clayton » fire extinguishing and disinfecting machines.

*Brise-glace*, *chalutier*, *drague*, *drague-aspiratrice*, *drague-porteuse*, *porteur*, *remorqueur* mean : ice-breaker, trawler, dredger, suction-dredger, hopper-dredger, hopper, tug.

The figures placed in brackets indicate the date from which the classification granted begins to run.

### CLASSIFICATION.

Reference must be made to the Rules for the classification of wooden and iron vessels, given at the beginning of the Register, in order to better understand the informations and the signs given in the 4<sup>th</sup>, 5<sup>th</sup> and 6<sup>th</sup> columns. These Rules contain full particulars or the classification and for the construction of vessels.

### 4th COLUMN.

1<sup>o</sup> **Iron and steel vessels.** — The classification of iron and steel vessels is expressed as follows :

I,	①,	①	3/3,	signifies: 1 <sup>st</sup> division.		
II,	②,	②	3/3,	»	2 <sup>d</sup>	»
III,	③,	③	3/3,	»	3 <sup>d</sup>	»

The divisions are granted according to the prescriptions of the articles 2, 9 and following of the rules for iron vessels.

The classification of composite vessels (iron and wood) is expressed as follows :

① 3/3, ② 3/3, ③ 3/3.

P. R. Means that the bow has been strengthened in view of navigating through ice.

2<sup>o</sup> **Wooden Vessels.** — The figures in this column indicate the division assigned to the vessel and the term of years assigned to the character given in the following column.

The division is expressed by a number included from 3 to 16 and represents the category which the vessel belongs to according to articles 7, 20 and following, and to the Tables at the end of the present Rules for wooden vessels. The term is granted in conformity to the prescriptions of articles 9 to 18 inclusively.

When there is only one figure in the 4<sup>th</sup> column, it indicates the division for which the vessel has been classed by her original construction. This can only exist for vessels classed 3/3 and whose

building dates from a number of years inferior to that indicated by the division.

When there are two figures, the first shows the division assigned to the vessel, the second expresses the duration given to the character, which accounts from the date entered between brackets in the 3<sup>rd</sup> column.

Thus:

16-4 signifies : division 16 years, classed for 4 years ;

7-3 » » 7 » » » 3 »

When, in the Supplements, the word « voyage » replaces this figures, it means that the class has only been confirmed for the time of an indicated voyage.

#### 5th & 6th COLUMNS

#### CHARACTERS AND NAVIGATION MARKS.

The fractions inserted in the 5th column express the confidence deserved by the vessels in conformity with the reports of the Surveyors ; 3/3 is the character of first class vessels ; 3/4 the character of inferior vessels.

For iron vessels, the character applies especially to their wooden parts, their rigging and outfit ; the qualities of the hulls being represented by the division to which the vessels belongs to.

The character is always followed by two figures placed in the 6th column, and which indicate separately ; the one on the left, the qualities of the hull ; the one on the right, those of the rigging and outfit. These figures vary from 1 to 3 ; the figure 1 applies to hulls and outfit of first class vessels ; 2 and 3 indicate that their state is in a more or less inferior condition.

In fact, the different characters obtainable by a vessel are as follows :

3/3, 1.1.

3/6, 1.1.

3/6,\* 2.1.

3/4, 2.1.

2/3, 3.2.

1/2 3.2.

The character is expunged and replaced by Marks (—) :

1° When the class has expired or when the vessel deserves no longer her class in conformity with the Rules, article 6 for wooden vessels and for iron vessels.

2° In case of incomplete surveys.

The dots (....) instead of the character with the latter in brackets, reported in the 3<sup>rd</sup> column, show that the vessel has not been submitted to one of the surveys required by Art. 6 and 10 ; or that she has not received the repairs indicated by the surveyor.

The letters, placed to the right of the figures, indicate the voyages for which the vessel is considered fit :

A. (*Atlantic*). Voyages to the East Coast of North and South-America and West Coast of Africa and navigation in the Indian & Pacific Oceans.

G. (*Great Coasting trade*). Voyages to the White Sea, Baltic, Coast of Spain and Portugal, Azores, Canaries, Mediterranean, Gulf of Venice, Archipelago, and Black Sea, etc.

I. (*Interior*), denotes that the vessel deserves her character for inland navigation only.

L. (*Long Voyages*). Voyages beyond Cape Horn and Cape of Good Hope.

Lakes. Navigation on the great Lakes or inland seas.

M. Special navigation in the *Mediterranean*.

P. (*Small Coasting trade*). Voyages between ports not far from each other, viz : from Bordeaux to Rouen ; from Marseilles to Gibraltar ; from Amsterdam to Christiania.

R. *Port and Roadstead purposes*.

Y. Yachting.

A. P. } denotes that the anchors (A. P.), or chains (C. P.), or  
C. P. } anchors and chains (A. & C. P.), have been tested at a  
A. & C. P. } machine recognized by the *Bureau Veritas*.

*Cote prévue*. — Class Contemplated.

7th COLUMN.

RIGGING.

Bk	— Brik.	Glt	— Schooner
Bk-Glt	— Brigantine.	Kn	— Kahn.
Bq	— Bark	Kt	— Ketch.
Bq-Glt	— Barkentine.	Lg	— Lugger.
Ctt	— Cutter.	Slp	— Sloop.
Dy	— Dandy.	1 m	— 1 mast.
G 3m	— 3 mast schooner.	3 m	— Ship.
G 4m	— 4 mast schooner.	4 m	— 4 masts.

The number of decks is shown below the rigging.

1 P-B	denotes : single deck with orlop beams.
2 P	» two decks.
2 P-A	» two decks — shadedeck.
2 P-S	» two decks — spardecked vessel.
2 P-B	» two decks with orlop beams.
2 P-H	» two decks — awningdeck or hurricanedeck.
2 P-B-S	» two decks — spardecked vessel with orlop beams
3 P	» three decks.
3 P-S	» three decks — spardecked vessel.
T	» tanksteamer.

Vessels without the above marks under the rigging have a single deck.

*Awningdeck* or *Hurricanedeck*. Vessels where the main deck is covered with a light deck.

*Shadedeck*. Vessels where the main deck is covered with a light deck wholly or partly open at the sides.

*Spardeck*. Vessels where the space under the upperdeck is used solely for the accommodation of the crew and passengers, and for the stowage of light goods such as are termed measurement goods.

*Welldeck*. Vessels having a forecastle and a long-raised quarter-deck, or a poop joined to a bridgehouse.

8th COLUMN.

TONNAGE AND DECKS.

The 3 numbers indicate respectively : 1° the gross tonnage (all erections on deck included); 2° the nett or Register tonnage; 3° the tonnage under the upper deck (without any deduction).

When only one tonnage is indicated, it is the nett tonnage.

9th COLUMN.

FLAGS.

Alm	— German.	Itl	— Italian.
Amr	— American.	Jap	— Japanese.
Ang	— English.	Mtn	— Montenegro
Arg	— Argentine.	Nrw	— Norwegian.
Aut	— Austrian.	P.B	— Dutch.
Blg	— Belgian.	Prs	— Persian.
Brs	— Brazilian.	Prv	— Peruvian.
Chl	— Chilian.	Ptg	— Portuguese.
Chn	— Chinese.	Rmn	— Roumanian
Cub	— Cuban.	Rss	— Russian.
Dan	— Danish.	Sds	— Swedish.
Egp	— Egyptian.	Tns	— Tunisian.
Esp	— Spanish.	Trc	— Turkish.
Frç	— French:	Urg	— Uruguay.
Grc	— Greek.	Vnz	— Venezuela.

10th COLUMN.

Year in which the vessel was built :

. . 98, . . 05, denote: 1898, . . 1905.

For wooden vessels O. denotes that the vessel was opened, thus: O.97, O.05, opened in 1897, 1905.

For iron vessels V. denotes that the vessel was submitted to survey article 6 of the Rules, thus: V.05, surveyed in 1901. In this case, the date of Classification will take course from the date of this survey.

The marks III<sup>1</sup>, III<sup>2</sup>, III<sup>3</sup> indicate that the vessel has been submitted for the first, the second or third time to the 12 years' survey required by article 6 of the rules.

11th COLUMN.

BUILDER; PORT OF BUILDING

12th COLUMN.

MATERIALS.

A.	— Steel.	Hk.	— Hackmatack, Tamarack or Juniper.
Ac.	— Locust.	ML.	— Larch.
Acj.	— Mahogany.	Nr.	— Walnut.

Cd.	— Cedar.	PP.	— Pitchpine.
Cp.	— Cypress.	S.	— Fir.
F.	— Iron	Sp.	— Spruce.
Gr.	— Greenheart.	T.	— Teak.
Ht.	— Beech.		

CONSTRUCTION, BOLTING, SHEATHING, REPAIRS, ETC.

grp. rc., or SS. — indicates : large repairs, rebuilt, restoration or special survey. (See Art. 12, 13 & 15.)

A.	— fore body.	aub.	— paddles.
A.	— after body.	B.	— under boilers.
a cl.	— clincher built.	b.	— wood.
alg.	— lengthened.	C.	— peak.

car.	— bottom caulked or painted	hél.	— screw.
cell.	— cellular.	hél. aux.	— auxiliary screw.
ch.	— bolted.	M.	— midships.
comp.	— compartment.	m.	— metal (yellow).
cv.	— copper.	n.	— new.
D.	— poop.	p.	— deck.
$\frac{1}{4}$ D.	— raised quarter deck.	R.	— bridgehouse.
d.	— sheathed.	rc.	— rebuilt.
E.	— under engines.	rmq.	— tugboat.
exh.	— raised.	rp.	— repaired.
fd-plt	— flat bottom.	s.	— upper.
fr.	— iron.	{sal}	— salted.
frg.	— galvanized iron.	sfb.	— single bottom.
ft.	— felt.	1/2 v.	— part ceiling.
G.	— forecastle.	WB.	— waterballast.
$\frac{1}{2}$ G.	— sunk forecastle.	WT.	— water tank.
G-E.	— large hatchways.	z.	— zinc.
grp.	— large repairs.		

Sff. — wood sheathed.

Sff. pr. : boot topping.

. . . . 98 . . . . 05, denote : 1898 . . . . 1905.

*Awningdeck; Hurricanedeck; Shadedeck; Spardeck; Welldeck;* see 7<sup>th</sup> column.

13th, 14th and 15th COLUMNS.

PRINCIPAL DIMENSIONS.

The length, breadth and depth are given in metres and centimetres and in feet and inches according registered measurement of each country when obtainable.

1 metre is equal to 3 feet 3  $\frac{3}{8}$  inches (English measure).

16th COLUMN.

*Free-Board* : 1<sup>st</sup> number : Summer navigation ; 2<sup>d</sup> number : Winter navigation ; 3<sup>d</sup> number : (W.N.A.) navigation in North Atlantic, winter time, in inches.

The brackets [ ] indicate that the loadline, as far as known, is not marked on the ship's sides.

The lines      indicate that the loadline has been cancelled on account of expiration or alteration of the class.

For the abbreviations of the port names see 19<sup>th</sup> Column in sailing vessels.

# ERKLÄRUNG DER ABKÜRZUNGEN

## SEGELSCHIFFE

### ERSTE SPALTE

Das  bezeichnet, dass das Schiff unter spezieller und fortdauernder Aufsicht der Experten des Bureau Veritas gebaut ist. (Siehe Artikel 5, § 4 der Vorschriften für hölzerne und Art. 3, für eiserne Schiffe).

### 2te SPALTE.

Laufende Nummern, mit welchen die Nummern in den Nachträgen korrespondieren.

### 3te SPALTE.

#### NAMEN DER SCHIFFE UND DER KAPITÄNE.

##### BEGINN DER KLASSE.

Die Schiffe sind im Register nach alphabetischer Ordnung ihrer Namen, sowie ihrer Flaggen und nach ihrer Grösse eingetragen.

Zusammengesetzte Schiffsnamen suche man unter dem Anfangsbuchstaben des ersten Wortes :

z. B. *Albert-Renée* unter dem Buchstaben A; *John-Bull* unter J; *Weser-Zeitung* unter W, u. s. w.

Die Zahlen, welche beim Kapitän's-Namen angegeben sind, bedeuten : die erste, das Jahr, in welchem der Kapitän sein Patent erhielt; die zweite dasjenige, in welchem er die Führung seines Schiffes übernommen hat.

Die hinter den Buchstaben p.c. stehenden Zahlen bezeichnen den Dampfdruck des Hilfskessels in Kilogramm und Pfund und das Datum der letzten Besichtigung.

Das Wort « Clayton », nach dem Namen eines Schiffes stehend, bedeutet, dass dieses mit einem Clayton'schen Apparat zum Desinfizieren und Feuerlöschen versehen ist.

*ELECTA.* bezeichnet, dass das Schiff elektrisch beleuchtet ist.

*Moteur aux.* — Bedeutet dass das Schiff mit einem motor zum Betrieb der Schraube versehen ist.

Die Zahlen in Parenthesen bezeichnen das Datum (Monat und Jahr), wann die Klasse ihren Anfang nimmt.

##### KLASSIFIKATION.

Zum besseren Verständniss der in der 4ten, 5ten und 6ten Spalte eingetragenen Klassen-Bezeichnungen verweisen wir auf die Vorschriften für den Bau hölzerner und eiserner Schiffe, welche dem Register vorangedruckt sind. Diese Vorschriften enthalten ausführliche Bestimmungen über den Bau und die Klassifikation der Schiffe.

### 4te SPALTE.

**1o Hölzerne Schiffe.** — Die in dieser Spalte befindlichen Zahlen bezeichnen die *Abteilung oder den Typus*, zu welchem das Schiff gehört und die Dauer, für welche die in der folgenden Spalte angegebene Klasse Gültigkeit hat.

Dieser Typus wird durch eine zwischen 3 und 16 schwankende Zahl ausgedrückt, welche eine der verschiedenen Kategorien bezeichnet, in welche die Schiffe den Artikeln 7, 20 und folgenden, sowie den am Schlusse der Bauvorschriften befindlichen Tabellen gemäss zerfallen. Die Dauer der Klasse wird nach den Vorschriften der Artikel 9 bis 18 bestimmt.

*Befindet sich in der 4ten Spalte nur eine Zahl*, so bezeichnet dieselbe den Typus, zu welchem das Schiff, seiner ursprünglichen Bauart nach, gehört. Dieser Fall kann nur für solche Schiffe eintreten, welche 3/3 klassifiziert sind und deren Alter niedriger ist als die Zahl, welche den Typus ausdrückt.

*Befinden sich in dieser Spalte dagegen zwei Zahlen*, so bedeutet die erste den Typus, zu welchem das Schiff gehört und die zweite gibt die Dauer an, für welche die Klasse, von dem in der 3ten Spalte in Parenthese eingetragenen Datum beginnend, Gültigkeit hat; so bedeutet z. B. :

**16-4**, dass das Schiff zum Typus von **16** Jahren gehört und für **4** Jahre klassifiziert ist, und **7-5**, dass das Schiff zum Typus von **7** Jahren gehört und für **5** Jahre klassifiziert ist.

Wenn in den Nachträgen das Wort « Voyage » diese Zahlen ersetzt, so ist die Klasse nur für die Dauer einer bestimmten Reise bestätigt.

**2o Schiffe aus Eisen und Stahl.** — Die Klassifikation der aus Eisen und Stahl erbauten Schiffe wird folgenderweise ausgedrückt:

<b>I.</b>			3/3, bedeutet 1ste Division.
<b>II.</b>			3/3, » 2te »
<b>III.</b>			3/3, » 3te »

Diese Divisionen werden nach den Bestimmungen der Artikel 2, 9

In folgenden Fällen fällt die Klasse fort und wird durch zwei Striche (— —) ersetzt :

1° Bei Ablauf der dem Vertrauenszeichen gewährten Dauer, wie auch in den in Art. 6 der Vorschriften für hölzerne Schiffe und im Art. 6 derjenigen für eiserne Schiffe vorgesehenen Fällen.

2° Bei unvollständigen Besichtigungen.

Wenn Punkte ( . . . . ) an Stelle der Klassifikations-Ziffern gesetzt sind, und die Klasse eingeklammert in der 3<sup>te</sup> Spalte aufgeführt ist, so wird dadurch angezeigt, dass das Schiff nicht der in Art. 6 geforderten Besichtigung unterzogen worden ist ; oder dass die, von dem Experten vorgeschriebene Reparaturen nicht ausgeführt sind.

Die Schiffsahrts-Zeichen zur Rechten der Bruchzahlen zeigen die Risiken an, für die das Schiff sich eignet.

A. bezeichnet : *Atlantische Fahrt*, d. h. von und nach der östlichen Küste Nord- und Süd-Amerikas und der westlichen Küste Afrikas, oder Zwischenfahrten in den Indischen Gewässern und im Stillen Ozean.

G. bezeichnet : *grosse Küstenfahrt*, oder Schiffsahrt zwischen europäischen Häfen an der Nordsee und am Atlantischen Ozean ; zwischen Häfen des Eismeer und der Ostsee ; der spanischen und portugiesischen Küste, der azorischen und kanarischen Inseln, des Mittelländischen und des Adriatischen Meeres, des Archipels und des Schwarzen Meeres, u. s. w.

I. bezeichnet : *Binnenfahrt*, d. h. Fluss-Schiffsahrt.

L. bezeichnet : *Lange Fahrt*, oder Schiffsahrt über das Cap Horn und Cap der Guten Hoffnung hinaus.

Lakes bezeichnet : Fahrten auf den grossen amerikanischen Seen oder Binnenseen.

M. bezeichnet : *Mittelmeer Fahrt*, d. h. insbesondere Schiffsahrt im Mittelländischen Meere.

P. bezeichnet : *kleine Küstenfahrt*, oder Schiffsahrt zwischen nahe bei einander gelegenen Häfen, z.B. von Bordeaux nach Rouen ; von Marseille nach Gibraltar ; von Amsterdam nach Christiania, u. s. w.

R. bezeichnet : *Fahrten auf der Rhede*.

Y. bezeichnet : Lustfahrten (Yachting).

und folgenden der Bauvorschriften für eiserne und stählerne Schiffe festgestellt.

Die Klassifikation der aus Eisen und Holz erbauten Schiffe (composite vessels) wird wie folgt ausgedrückt :

 3/3,  3/3, und  3/3,

P. R. bedeutet, dass das Schiff gegen die Gefahren im Eise mit besonderen Verstärkungen am Bug versehen ist.

#### 5<sup>te</sup> und 6<sup>te</sup> SPALTE.

#### VERTRAUENS- U. SCHIFFAHRTS-ZEICHEN.

Die in der 5<sup>ten</sup> Spalte eingetragenen Bruchzahlen bezeichnen das Vertrauen, dessen die Schiffe dem Berichte der Experten gemäss wert erachtet worden sind. 3/3 wird solchen Schiffen erteilt, die sich in durchaus gutem Zustande befinden, während 3/4 das Vertrauenszeichen für Schiffe von mittelmässiger Beschaffenheit ist.

Bei eisernen Schiffen bezieht sich diese Bruchzahl (Klasse) hauptsächlich auf die aus Holz bestehenden Konstruktionsteile, die Takelage und das sonstige Zubehör. Der Wert oder die Beschaffenheit des eigentlichen Schiffskörpers wird durch die Division, zu welcher das Schiff gehört, repräsentiert.

Die eigentliche Klasse wird immer durch zwei in der 6<sup>ten</sup> Spalte befindliche Ziffern ergänzt, von denen die erste auf die Beschaffenheit des Rumpfes, die zweite dagegen auf die Takelage und das Zubehör Bezug hat. Die Ziffer 1 bedeutet, dass Rumpf und Zubehör sich in sehr gutem Zustande befinden, während 2 und 3 angeben, dass der Unterhaltungszustand des Rumpfes oder der Takelage, etc. mehr oder weniger zu wünschen übrig lässt.

Kurzum, die verschiedenen Klassen, welche ein Schiff erhalten kann, werden in folgender Weise ausgedrückt :

3 3. 1. 1.

3 6. 1. 1.

3 6<sup>\*</sup>. 2. 1.

3 4. 2. 1.

2 3. 3. 2.

1 2. 3. 2.

A. P. } bezeichnet: dass entweder die Anker (A. P.), oder die  
C. P. } Ketten (C. P.), oder auch beide Teile (A. & C. P.)  
A. & C. P. } auf einer von der Verwaltung anerkannten Ma-  
schine den vom *Bureau Veritas* verlangten Proben  
unterworfen worden sind.

*Cote prévue* : Klasse vorgesehen.

7te SPALTE.  
TAKELUNG.

Alg — Leichter.	Kff — Kuff.
Bk — Brigg.	Kn — Kahn.
B-G — Schooner-Brigg.	Kt — Ketch.
Bmb — Bombarde.	Lg — Lugger.
Bq — Bark.	Plc — Polacker.
Bq-Glt — Schooner-Bark.	Slp — Schaluppe.
Bsq — Bisquine.	Sk — Smack.
Chal — Leichter.	Sng — Schnigge.
Ch-M — Chasse-Marée.	Ttn — Tartane.
Ctt — Kutter.	Tk — Tjalk.
Dg — Dogger.	1 m — einmastiges Fahr- zeug.
Dy — Dandy.	3 m — Vollschiif.
Ev — Ewer.	4 m — Viermast-Schiif.
G 3m — Dreimast-Schooner.	
Glo — Galiote.	
Gls — Galeasse.	
Glt — Schooner.	
Hr — Houri.	
Jgt — Jacht.	

Zusatz-Bezeichnungen.

dv — mit Schwertern.
bse — mit Schlagmasten.
Barge, Chaland — Leichter.

Die Anzahl der Decks ist unter der Bezeichnung der Takelage angegeben, und zwar bedeutet :

- 1 P-B — Ein Deck und eine Lage Raumbalken.
- 1 P+Bp — Ein Deck mit Raumbalken und teilweisem Zwischendeck.
- 2 P — Zwei Decks.
- 2 P-S — Zwei Decks, von denen das eine ein Spardeck ist.
- 2 P-H — Zwei Decks, von denen das eine ein Awningdeck ist.
- 2 P-B — Zwei Decks und eine Lage Raumbalken.
- 2 P-B-S — Zwei Decks, von denen das eine ein Spardeck ist, und eine Lage Raumbalken.
- 3 P — Drei Decks.
- 3 P-S — Drei Decks, von denen das eine ein Spardeck ist.

Wenn keine dieser Bezeichnungen angegeben ist, so hat das Schiff nur ein Deck.

*Hurricanedeck oder Awningdeck.* — Schiffe, deren Hauptdeck mit einem leichten Deck überdeckt ist.

*Shadedeck (Schirmdeck).* — Schiffe, deren Hauptdeck mit einem leichten, an den Seiten ganz oder teilweise offenen Deck überdeckt ist.

*Spardeck.* — Schiffe, deren oberstes Zwischendeck für die Mannschaft und Passagiere oder für den Transport leichter Waaren bestimmt ist.

*Welldeck.* — Schiffe, deren Quarterdeck mit dem Brückendeck, oder deren Poop und Quarterdeck mit dem Brückendeck verbunden sind und die ausserdem noch eine Back haben.

8te SPALTE.

VERMESSUNG DER SCHIFFE IN REGISTERTONS.

Die 3 hier eingetragenen Zahlen geben die Vermessung des Schiffes in Registertons an, und zwar bezeichnet die OBERE den Brutto-Tonnengehalt, also einschliesslich sämtlicher Decksaufbauten, die MITTLERE den Netto-Raumgehalt, also nach Abzug der nicht zur Ladung benutzten Räume, und die UNTERE den Tonnengehalt unter dem Oberdeck (bezw. dem zweiten Deck in Hurricanedeck-Schiffen).

Findet sich an dieser Stelle nur eine Zahl, so bezeichnet dieselbe stets den Netto-Tonnengehalt.

9te SPALTE.  
FLAGGEN.

Alm — Deutsche.	Dan — Dänische.
Amr — Amerikanische.	Dmn — St-Domingo.
Ang — Englische.	Ecd — Ecuador.
Arg — Argentinische.	Egp — Egyptische.
Aut — Oesterreichische.	Esp — Spanische.
Blg — Belgische.	Frç — Französische.
Blv — Bolivianische.	Grc — Griechische.
Brs — Brasilianische.	Hait — Haitische.
Bul — Bulgarische.	Itl — Italienische.
C-R — Costa-Rica.	Jap — Japanische.
Chl — Chilenische.	Mtn — Montenegro.
Chn — Chinesische.	Mxc — Mexikanische.
Col — Columbische.	Nic — Nicaragua.
Cub — Cuba.	Nrw — Norwegische.

P. B	— Holländische.	Sds	— Schwedische.
Prs	— Persische.	Tns	— Tunesische.
Prv	— Peruanische.	Tre	— Türkische.
Ptg	— Portugiesische.	Urg	— Uruguay.
Rmn	— Rumänische.	Vnz	— Venezuela.
Rss	— Russische.	Zzb	— Zanzibar.

10<sup>te</sup> SPALTE.

Baujahr, ... 91, ... 05, bedeuten: 1891, ... 1905.

Bei hölzernen Schiffen bedeutet die unter dem Baujahre aufgeführte Bezeichnung O. 98, O. 05, u. s. w., dass das Schiff in diesen Jahren geöffnet worden ist.

Bei eisernen Schiffen bedeutet die Bezeichnung V. 05, u. s. w., dass das Schiff in diesen Jahren nach Art. 6 der Vorschriften für eiserne Schiffe besichtigt worden ist.

III<sup>1</sup>, III<sup>2</sup> oder III<sup>3</sup> bedeutet dass das Schiff der ersten, zweiten oder dritten zwölfjährigen Besichtigung, nach Art. 6 der Vorschriften, unterworfen wurde.

11<sup>te</sup> SPALTE.

BAUORT UND BAUMEISTER.

12<sup>te</sup> SPALTE.

DIE ZUM BAUE DES SCHIFFES VERWENDETEN MATERIALIEN.

A. (Acier) — Stahl.	Hk. — Hackmatack.
Ac. — Acazienholz.	Hml — Hemlock.
Acj. — Mahagoniholz.	ML — Lärchenholz.
B. — Birkenholz.	Mr. — Kirschbaumholz.
B. d. F. — Eisenholz.	Nr. — Nussbaumholz.
C. — Eichenholz.	Ol. — Olivenholz.
Cd. — Cederholz.	Or. — Ulmenholz.
Ch. — Kastanienholz.	P. — Fichtenholz.
Cp. — Cypressenholz.	PP. — Pitch-Pine.
Er. — Ahornholz.	S. — Tannenholz(Föhner)
F. (Fer) — Eisen.	Sp. — Spruce.
Gr. — Greenheart.	T. — Teakholz.
Ht. — Buchenholz.	

BAUART, VERBOLZUNG, BESCHLAG, REPARATUREN, u. s. w.

SS. grp. oder rc., bedeuten, dass das Schiff unter spezieller Aufsicht der Experten der Verwaltung, den Art. 12, 13 oder 15 der Vorschriften für hölzerne Schiffe gemäss einer vollständigen Besichtigung, einer grossen Reparatur oder einem Umbaue unterworfen wurde.

à cl.	— Klinker gebaut.	m.	— Yellow-Metall.
alg.	— verlängert.	n.	— neu.
b.	— Holz.	p.	— Deck.
car.	— Boden kalfatert. (Bei eisernen Schiffen, Bodenbesichtigung.)	pr. ch. fr.	— Berghölzer mit Eisen befestigt.
ch.	— verbolzt.	q. ch. fr.	— Kiel mit Eisen befestigt.
cv.	— Kupfer.	rc.	— umgebaut.
d. (m.)	— Mit Metall beschlagen.	rp.	— repariert.
d. g.	— galvanischer Beschlag.	S. A.	— ohne Pumpensood.
exh.	— (Deck) erhöht.	S. C.	— » Kniee.
fd-plt	— platter Boden.	S. V.	— » Wägern.
fr.	— Eisen.	s.	— ober.
frg.	— galvanisiertes Eisen.	sal.	— gesalzen.
ft.	— Filz.	sfb.	— ohne Beschlag.
G-E	— grosse Luken.	WB.	— Wasserballast.
grp.	— grosse Reparaturen.	z.	— Zink.
		1/2 V.	— halb gewägt.

Sff. : Holzumschlag. — Sff. pr. : Spikerhaut. Center Board : Mittelschwert.

97, ..... 05 bedeutet : 1897, ..... 1905.

*Awningdeck; Hurricanedeck, Shadedeck, Spardeck, Welldeck* : siehe Erläuterungen zur 7<sup>ten</sup> Spalte.

13<sup>te</sup>, 14<sup>te</sup> und 15<sup>te</sup> SPALTE.

HAUPT-DIMENSIONEN :

*Länge, Breite und Tiefe* des Schiffes in Meter und Centimeter und in engl. Fuss und Zoll so viel wie möglich nach dem offiziellen Messtrief der Registerbehörde seines Heimatshafens.

1 Meter = 3 Fuss 3 <sup>3</sup>/<sub>8</sub> Zoll (Engl.)

16<sup>te</sup> SPALTE.

*Freibord* : 1<sup>te</sup> Zahl; für alle Jahreszeiten in Salz- Wasser; 2<sup>te</sup> Zahl (W. N. A.) für die Nord-Atlantische Fahrt im Winter, in Engl. Zoll.

Die Zahlen zwischen [ ] bedeuten, dass die Ladelinie, soweit uns bekannt, nicht an der Schiffsseite angebracht ist.

Das Zeichen  bedeutet, dass der Freibord annulliert ist, weil die Klasse gestrichen oder geändert wurde.

17<sup>te</sup> SPALTE.

HEIMATSHAFEN DES SCHIFFES

18<sup>te</sup> SPALTE.

NAME DES RHEDERS.

Name des Rheders, bezw. des Korrespondent-Rheders (und event. seines Wohnortes, falls dieser ein anderer ist als der Heimathafen des Schiffes).

19te UND LETZTE SPALTE.

WOHNORT DES EXPERTEN, DER DAS SCHIFF ZULETZT BESICHTIGTE, UND DATUM DER LETZTEN BESICHTIGUNG.

Die Zahlen welche nach den Abkürzungen der Hafennamen stehen, bezeichnen den Monat und das Jahr der letzten Besichtigung.  
Die Buchstaben c. v. nebst Zahl (Monats- oder Jahreszahl) geben an, dass die Kalfaterung des Bootes an dem betreffenden Datum untersucht ist.

# DAMPFSCHIFFE.

## ERSTE SPALTE.

Das ✠ bezeichnet, dass das Schiff unter spezieller und fortdauernder Aufsicht der Experten des Bureau Veritas gebaut ist. (Vergl. Art. 5, § 4 der Vorschriften für hölzerne und Art. 3, für eiserne Schiffe.)

## 2te SPALTE.

Laufende Nummern, mit welchen die Nummern in den Nachträgen korrespondieren.

## 3te SPALTE.

### NAMEN DER DAMPFSCHIFFE UND IHRER KAPITÄNE.

#### DATUM DES BEGINNS DER KLASSE.

Die Schiffe sind im Register nach alphabetischer Ordnung ihrer Namen und ihrer Flaggen, und nach ihrer Grösse eingetragen.

Wenn der Name eines Dampfschiffes aus mehr als einem Worte besteht, so suche man ihn unter dem Anfangsbuchstaben des ersten Wortes :

z. B. *A.-Wicander* ist unter dem Buchstaben A zu finden; *La Corse* unter L; *W.-G. Hall* unter W, etc.

Die Zahlen, welche beim Kapitäns-Namen angegeben sind bedeuten : Die erste, das Jahr, in welchem der Kapitän sein Patent erhielt, die zweite dasjenige, in welchem er die Führung seines Schiffes übernommen hat.

Das Wort « Clayton » nach dem Namen eines Schiffes stehend, bedeutet, dass dieses mit einem Clayton'schen Apparat zum Desinfizieren und Feuerlöschen versehen ist.

*ELECTR.* Bedeutet, dass das Schiff mit elektrischer Beleuchtungs-Anlage versehen ist.

Bac	} Fähr.	Drague	} Bagger	Porteur	} Prähm
Railway Ferry		Dredger		Hopper	
Brise-glace	} Eisbrecher	Drague-aspiratrice	} Saug-	Remorqueur	} Schlep-
Icebreaker		Suction-dredger		Tug	
Chalutier-Fischdampfer		Drague-porteuse	} Bagger-		
		Hopper-dredger			

Cable ship — Kabelschiff.

Oil in bulk — Ölladung in Massen.

Petrol. in bulk — Petroleumladung in Massen.

Die eingeklammerten Zahlen bezeichnen das Datum (Monat und Jahr), an welchem die Dauer der Klasse beginnt.

## KLASSIFIKATION.

Zum besseren Verständniss der in den nächstfolgenden Spalten 4, 5 und 6 angeführten Klassen-Bezeichnungen verweisen wir auf die Vorschriften für hölzerne und eiserne Schiffe, welche dem Register vorangedruckt sind. Diese Vorschriften enthalten ausführliche Bestimmungen über die Klassifikation und den Bau der Schiffe.

## 4te SPALTE.

**1° Schiffe aus Eisen und Stahl.** — Die Klassifikation der aus Eisen und Stahl erbauten Schiffe wird in folgender Weise ausgedrückt :

<b>I,</b>			3/3, bedeutet 1 <sup>ste</sup> Division.
<b>II,</b>			3/3, » 2 <sup>te</sup> »
<b>III,</b>			3/3, » 3 <sup>te</sup>

Diese Divisionen werden nach den Bestimmungen der Artikel 2, 9 und folgenden der Klassifikations- und Bau-Vorschriften für eiserne und stählerne Schiffe festgestellt.

Die Klassifikation der aus Eisen und Holz erbauten Schiffe (composite vessels) wird, wie folgt, ausgedrückt

 3/3,  3/3, und  3/3.

P. R. bedeutet, dass das Schiff gegen die Gefahren im Eise mit besonderen Verstärkungen am Bug versehen ist.

**2° Hölzerne Schiffe.** — Die in dieser Spalte befindlichen Zahlen bezeichnen die Abteilung oder den Typus, zu welchem das Schiff gehört, und die Dauer, für welche die in der folgenden Spalte angegebene Klasse Gültigkeit hat.

Dieser Typus wird durch eine zwischen 3 und 16 schwankende Zahl ausgedrückt, welche eine der verschiedenen Kategorien bezeichnet, in welche die Schiffe den Artikeln 7, 20 und folgenden,

sowie den am Schlusse der Bau-Vorschriften befindlichen Tabellen gemäss zerfallen. Die Dauer der Klasse wird nach den Vorschriften der Artikel 9 bis 18 bestimmt.

*Befindet sich in der 4<sup>ten</sup> Spalte nur eine Zahl*, so bezeichnet dieselbe den Typus, zu welchem das Schiff, seiner ursprünglichen Bauart nach, gehört. Dieser Fall kann nur für solche Schiffe eintreten, welche 3/3 klassifiziert sind und deren Alter niedriger ist als die Zahl, welche den Typus ausdrückt.

*Befinden sich in dieser Spalte dagegen zwei Zahlen*, so zeigt die erste den Typus an, zu welchem das Schiff gehört, und die zweite gibt die Dauer an, für welche die Klasse von dem, in der 3<sup>ten</sup> Spalte in Parenthese eingetragenen Datum an, Gültigkeit hat; so bedeutetz.B.:

**16-4**, dass das Schiff zum Typus von **16** Jahren gehört und für **4** Jahre klassifiziert ist, und **7-5**, dass das Schiff zum Typus von **7** Jahren gehört und für **5** Jahre klassifiziert ist.

Wenn in den Nachträgen das Wort « Voyage » diese Zahlen ersetzt, so ist die Klasse nur für die Dauer einer bestimmten Reise bestätigt.

*Cote prévue.* — Klasse vorgesehen.

#### 5te und 6te SPALTE.

#### VERTRAUENS- U. SCHIFFFAHRTS-ZEICHEN.

Die in der 5<sup>ten</sup> Spalte eingetragenen Bruchzahlen bezeichnen das Vertrauen, dessen die Schiffe dem Berichte der Experten gemäss wert erachtet worden sind. 3/3 wird solchen Schiffen erteilt, die sich in durchaus gutem Zustande befinden, während 3/4 das Vertrauenszeichen für Schiffe von mittelmässiger Beschaffenheit ist.

Bei eisernen Schiffen bezieht sich diese Bruchzahl (Klasse) hauptsächlich auf die aus Holz bestehenden Konstruktionsteile, die Takelage und das sonstige Zubehör. Der Wert oder die Beschaffenheit des eigentlichen Schiffskörpers wird durch die Division, zu welcher das Schiff gehört, repräsentiert.

Die eigentliche Klasse wird immer durch zwei in der 6<sup>ten</sup> Spalte befindliche Ziffern ergänzt, von denen die erste auf die Beschaffen-

heit des Rumpfes, die zweite dagegen auf die Takelage und das Zubehör Bezug hat. Die Ziffer 1 bedeutet, dass Rumpf und Zubehör sich in sehr gutem Zustande befinden, während 2 und 3 angeben, dass der Unterhaltungszustand des Rumpfes oder der Takelage, etc. mehr oder weniger zu wünschen übrig lässt.

Kurzum, die verschiedenen Klassen, welche ein Schiff erhalten kann, werden in folgender Weise ausgedrückt:

Erste Klasse . .	{	3/3, 1.1.
	{	3/6, 1.1.
Zweite Klasse . .	{	3/6*, 2.1.
	{	3/4, 2.1.
Dritte Klasse . .	{	2/3, 3.2.
	{	1/2, 3.2.

In folgenden Fällen fällt die Klasse fort und wird durch zwei Striche (— —) ersetzt:

1° Bei Ablauf der dem Vertrauenszeichen gewährten Dauer, wie auch in den in Art. 6 der Vorschriften für hölzerne Schiffe und im Art. 6 derjenigen für eiserne Schiffe vorgesehenen Fälle.

2° Bei unvollständigen Besichtigungen.

Wenn Punkte ( . . . . ) an Stelle der Klassifikations-Ziffern gesetzt sind und die Klasse eingeklammert in der 3<sup>ten</sup> Spalte aufgeführt ist, so wird dadurch angezeigt, dass das Schiff nicht der in Art. 6 und 10 geforderten Besichtigung unterzogen worden ist; oder dass die, von dem Experten vorgeschriebenen Reparaturen nicht ausgeführt sind.

Die Schifffahrts-Zeichen zur Rechten der Bruchzahlen zeigen die Reisen an, für die das Schiff sich eignet.

A. bezeichnet: *Atlantische Fahrt*, d. h. von und nach der östlichen Küste Nord- und Süd-Amerikas und der westlichen Küste Afrikas, oder Zwischenfahrten in den Indischen Gewässern und im Stillen Ozean.

G. bezeichnet: *grosse Küstenfahrt*, oder Schifffahrt zwischen europäischen Häfen an der Nordsee und am Atlantischen Ozean; zwischen Häfen des Eismeer und der Ostsee; der spanischen und portugiesischen Küste, der azorischen und kanarischen Inseln, des Mittelländischen und des Adriatischen Meeres, des Archipels und des Schwarzen Meeres.

I. bezeichnet: *Binnenfahrt*, d. h. Fluss-Schifffahrt.

L. bezeichnet: *Lange Fahrt*, oder Schifffahrt über das Cap Horn und Cap der Guten Hoffnung hinaus.

Lakes, bezeichnet: Fahrten auf den grossen amerikanischen Seen oder Binnenseen.

M. bezeichnet: *Mittelmeer Fahrt*, d. h. insbesondere für die Schifffahrt im Mittelländischen Meere geeignet.

P. bezeichnet: *kleine Küstenfahrt*, oder Schifffahrt zwischen nahe bei einander gelegenen Häfen, z. B. von Bordeaux nach Rouen; von Marseille nach Gibraltar; von Amsterdam nach Christiania, u. s. f.

R. bezeichnet: *Fahrten auf der Rhede*.

Y. bezeichnet: Lustfahrten (Yachting).

A. P. } bezeichnet, das entweder die Anker (A.P.), oder die Ket-  
C. P. } ten (C.P.), oder auch beide Teile (A. & C. P.) auf einer  
A. & C. P. } von der Verwaltung anerkannten Maschine den vom  
Bureau Veritas verlangten Proben unterworfen worden sind.

7te SPALTE.  
TAKELUNG.

Bk — Brigg.	Jgt — Jacht.
B-G — Schooner-Brigg.	Kff — Kuff.
Bq — Bark.	Kn — Kahn.
Bq-Glt — Schooner-Bark.	Kt — Ketch.
Ctt — Kutter.	Lg — Lugger.
Dy — Dandy.	Slp — Schaluppe.
G3m — Dreimast-Schooner	Tk — Tjalk.
Glo — Galiote.	1 m — einmastiges Schiff.
Gls — Galease.	3 m — Vollschiif.
Glt — Schooner.	4 m — Viermast-Schiif.

Die Anzahl der Decks ist unter der Takelage-Bezeichnung angegeben, and zwar bedeutet:

1 P-B — Ein Deck und eine Lage Raumbalken.

1 P-Bp — Ein Deck mit Raumbalken und teilweise Zwischen-deck.

2 P — Zwei Decks.

2 P-A — Zwei Decks, von denen das eine ein Schirmdeck (Shadedeck) ist.

2 P-B — Zwei Decks und eine Lage Raumbalken.

2 P-H — Zwei Decks, von denen das eine ein Hurricanedeck ist.

2 P-S — Zwei Decks, von denen das eine ein Spardeck ist.

2 P-B-S — Zwei Decks, von denen das eine ein Spardeck ist, und eine Lage Raumbalken.

3 P — Drei Decks.

3 P-S — Drei Decks, von denen das eine ein Spardeck ist.

T — Tankdampfer.

Wenn keine dieser Bezeichnungen angegeben ist, so hat das Schiff nur ein Deck.

*Hurricanedeck* oder *Awningdeck*. — Schiffe, deren Hauptdeck mit einem leichten Deck überdeckt ist.

*Shadedeck* (Schirmdeck). Schiffe, deren Hauptdeck mit einem leichten, an den Seiten ganz oder teilweise offenen Deck überdeckt ist.

*Spardeck*. Schiffe, deren oberstes Zwischendeck für die Mannschaft und Passagiere oder für den Transport leichter Waaren bestimmt ist.

*Welldeck*. — Schiffe, deren Quarterdeck mit dem Brückendeck, oder deren Poop und Quarterdeck mit dem Brückendeck verbunden sind und die ausserdem noch eine Back haben.

8te SPALTE.

VERMESSUNG DER SCHIFFE IN REGISTERTONS.

Die drei hier eingetragenen Zahlen geben die Vermessung des Schiffes in Registertons an, und zwar bezeichnet die **OBERE** den Brutto-Tonnengehalt, also einschliesslich sämtlicher Decksaufbauten, die **MITTLERE** den Netto-Raumgehalt, also nach Abzug der nicht für die Ladung oder Passagiere bestimmten Räume, und die **UNTERE** den Tonnengehalt unter dem Oberdeck (bezw. dem zweiten Deck in Hurricanedeck-Schiffen).

9te SPALTE.  
FLAGGEN.

Alm — Deutsche.	Arg — Argentinische.
Amr — Amerikanische.	Aut — Oesterreichische.
Ang — Englische.	Blg — Belgische.

Brs — Brasilianische.  
 Chl — Chilenische.  
 Chn — Chinesische.  
 Col — Columbische.  
 Cub — Cuba.  
 Dan — Dänische.  
 Dmn — St-Domingo.  
 Egp — Aegyptische.  
 Esp — Spanische.  
 Frç — Französische.  
 Gre — Griechische.  
 Hait — Haitische.  
 Haw — Hawaïische.  
 Itl — Italienische.  
 Jap — Japanische.

Mtn — Montenegro.  
 Mxc — Mexikanische.  
 Nrwl — Norwegische.  
 P.B — Holländische.  
 Prs — Persische.  
 Prv — Peruanische.  
 Ptg — Portugiesische.  
 Rmn — Rumänische.  
 Rss — Russische.  
 Sds — Schwedische.  
 Tns — Tunesische.  
 Trc — Türkische.  
 Urg — Uruguay.  
 Vnz — Venezulanische.

# 10te SPALTE.

Baujahr: ... 97, ... 05 bedeuten: ... 1897, ... 1905.

Bei hölzernen Schiffen bedeutet die unter dem Baujahre aufgeführte Bezeichnung O.99, O.05, u. s. f., dass das Schiff in diesen Jahren geöffnet wurde.

Bei eisernen Schiffen bedeutet die Bezeichnung V.99, V.05, u. s. f. dass das Schiff in diesen Jahren nach Art. 6 der Klassifikations-Vorschriften für eiserne Schiffe besichtigt worden ist.

III<sup>1</sup>, III<sup>2</sup> oder III<sup>3</sup> bedeutet dass das Schiff der ersten, zweiten oder dritten zwölfjährigen Besichtigung, nach Art. 6 der Vorschriften, unterworfen wurde.

# 11te SPALTE. BAUMEISTER UND BAUORT.

## 12te SPALTE. DIE ZUM BAUE DES SCHIFFES VERWENDETEN MATERIALIEN.

A. (Acier) — Stahl.	Ht. — Buchenholz.
Ac. — Acazienholz.	MI. — Lärchenholz.
Acj. — Mahagoniholz.	Nr. — Nussbaumholz.
B. — Birkenholz.	Ol. — Olivenholz.
C. — Eichenholz.	Or. — Ulmenholz.
Cd. — Cedernholz.	P. — Fichtenholz.
Cp. — Cypressenholz.	PP. — Pitchpine.
F. (Fer) — Eisen.	S. — Tannenholz (Föh-)
Gr. — Greenheart.	Sp. — Spruce. [ren].
Hk. — Hackmatack.	T. — Teakholz.

## BAUART, VERBOLZUNG, BESCHLAG, REPARATUREN, u. s. f.

SS. grp. oder rc., bedeuten, dass das Schiff unter spezieller Aufsicht der Experten des Bureau Veritas einer grossen Reparatur oder einem Umbaue unterworfen wurde.

A. — Vorderschiff.  
 AR. — Hinterschiff.  
 a cl. — auf Klinker gebaut.  
 alg. — verlängert.  
 aub. — Raddampfer.  
 b. — Holz.  
 car. — Boden besichtigt (bei hölzernen Schiffen, Boden kalfatert).  
 cell. — Zellensystem (beim Doppelboden).  
 ch. — verbolzt.  
 comp. — wasserdichte Abteilung.  
 cv. — Kupfer.  
 D. — Poop (hinterer Aufbau).  
<sup>1</sup>/<sub>2</sub> D. — Quaterdeck.  
 d. (m). — beschlagen (mit Metall).  
 E. — unter der Maschine.  
 exh. — (Deck) erhöht.  
 fd-plt — platter Boden.  
 fr. — Eisen.  
 frg. — galvanisiertes Eisen.  
 fi. — Filz.

G. — Back (vorderer Aufbau).  
<sup>1</sup>/<sub>2</sub> G. — vorsenkte Back.  
 G-E — grosse Luken.  
 grp. — grosse Reparaturen.  
 hél. — Schraube.  
 hél.aux. — Hilfschraube.  
 M. — Mittelschiff (mittschiffs).  
 m. — Yellow-Metall.  
 n. — neu.  
 p. — Deck.  
 R. — Brückendeck.  
 RA. — vorderes Deckshaus.  
 R.R. — hinteres Deckshaus.  
 rc. — umgebaut.  
 rp. — repariert.  
 s. — ober.  
 sal. — Salzang.  
 sfb. — ohne Beschlag.  
 1/2 V. — halb gewägert.  
 WB. — Wasserballast.  
 WT. — Wassertank.  
 z. — Zink.

Sff.: Holzumschlag. — Sff. pr.: Spikerhaut.

..... 98, ..... 05 bedeutet: 1898, ..... 1905.

Betreffs der Bezeichnungen:

*Awningdeck, Hurricane-Deck, Shadedeck, Spardeck, Welldeck.*  
 — vergleiche man die Erläuterungen zur 7ten Spalte und den Text des Art. 10, § 1 der Bauvorschriften für eiserne Schiffe.

## 13te, 14te und 15te SPALTE. — HAUPT-DIMENSIONEN.

Länge, Breite und Tiefe des Schiffes in Meter und Centimeter und in engl. Fuss und Zoll so viel wie möglich nach dem offiziellen Messbrief der Registerbehörde seines Heimatshafens.

1 Meter = 3 Fuss 3 <sup>3</sup>/<sub>8</sub> Zoll (Engl.).

## 16te SPALTE.

*Freibord*: 1ste Zahl, im Sommer; 2te Zahl, im Winter, 3te Zahl (W. N. A.) für die Nord-Atlantische Fahrt im Winter, in engl. Zoll.

Die Zahlen zwischen [ ] bedeuten dass die Ladelinie, soweit uns bekannt, nicht an der Schiffsseite angebracht ist.

Das Zeichen **==** bedeutet, dass der Freibord annulliert ist, weil die Klasse gestrichen oder geändert wurde.

## 17te SPALTE.

### HEIMATSHAFEN DES DAMPFERS.

## 18te SPALTE.

WOHNORT DES EXPERTEN, DER DAS SCHIFF ZULETZT BESICHTIGTE UND DATUM DER LETZTEN BESICHTIGUNG.

Wegen der Abkürzungen der Ortsnamen vergleiche man die Erläuterungen zur 19ten Spalte des Segelschiffs-Registers.

19te SPALTE.

LAUFENDE NUMMER, MIT DERJENIGEN IN SPALTE 1  
KORRESPONDIEREND.

20te SPALTE.

NAME DES RHEDERS,

bezw. des Korrespondent-Rheders (und event. seines Wohnortes,  
falls dieser ein anderer ist als der Heimatshafen des Schiffes).

MASCHINEN.

21ste SPALTE.

Das ✕ gibt an, dass die Maschinen unter spezieller Aufsicht  
gebaut worden sind.

22ste SPALTE.

SYSTEM DER MASCHINE UND DATUM DES CERTIFIKATES.

Comp. — Compound-Maschine (mit zweifacher Expansion).  
Diag. — Diagonale Anordnung der Cylinder.  
J. C. — Maschine mit Einspritz-Kondensation.  
Ord. — Einfache Maschine (Maschine mit einmaliger Expansion  
des Dampfes).  
Osc. — Maschine mit beweglichen Cylindern.  
Tand. — Maschine mit übereinander angeordneten Cylindern  
(an gemeinschaftlicher Kolbenstange wirkend).  
Tr. Exp. — Dreifache (Triple-) Expansions-Maschine.  
Qu. Exp. — Vierfache (Quadruple-) Expansions-Maschine.  
(Stehen diese Bezeichnungen allein, so ist allemal eine Maschine nach  
dem Dampfhammer-System mit Oberflächen-Kondensation ge-  
meint.)

23ste SPALTE.

ANZAHL DER CYLINDER

24ste SPALTE.

DURCHMESSER DER CYLINDER IN CENTIMETER UND IN ZOLL.  
PS. oder v. mit folgendem Datum — bezeichnet die letzte Besichtig-  
ung der Schraubenwelle.  
PS. n. — Bedeutet, dass die Schraubenwelle ausgewechselt wurde.  
PS. c. — Bedeutet, dass die Schraubenwelle durch eine andere, bereits  
in Gebrauch gewesene ersetzt wurde.  
B. — Bedeutet Backbord; T.-Steuerbord.

25ste SPALTE.

KOLBENHUB IN CENTIMETER UND IN ZOLL.

26ste SPALTE.

PFERDESTÄRKEN DER MASCHINE,  
und zwar bezeichnet die obere Zahl die nominellen, die untere  
dagegen die indizierten Pferdekkräfte.  
Zahl der Umdrehungen pro Minute.

27ste SPALTE.

ORT UND DATUM DER LETZTEN BESICHTIGUNG DER MASCHINE.

28ste SPALTE.

ERBAUER DER MASCHINE, SOWIE ORT UND JAHR DER ERBAUUNG

KESSEL.

29ste SPALTE.

Das ✕ gibt an, dass die Kessel unter spezieller Aufsicht gebaut  
sind.

30ste SPALTE.

ZAHL UND SYSTEM DER KESSEL.

C. — Cylindrischer Röhrenkessel.	E. — Elliptischer (ovaler) Kessel.
D. — Doppel-Kessel (von 2 Seiten zu feuern).	R. — Rechtwinkliger Kessel (Kof- ferkessel).
S. — Einfacher Kessel (von einer Seite zu feuern).	V. — Stehender Kessel.

Locom. — Locomotiv-Kessel.

31ste UND 32ste SPALTE.

DURCHMESSER UND LÄNGE DES KESSELMANTELS, IN METER,  
UND IN ENGL-FUSS UND ZOLL.

33ste SPALTE.

ANZAHL DER FEUERUNGEN.

34ste SPALTE.

GRÖSSE DER ROSTFLÄCHE IN QUADRAT-METER UND IN  
QUADRAT-FUSS.

35ste SPALTE.

GRÖSSE DER HEIZFLÄCHE IN QUADRAT-METER UND IN  
QUADRAT-FUSS.

36ste SPALTE.

KESSEL-ÜBERDRUCK DER HAUPT U. DER HÜLFSEKESSEL IN KILO-  
GRAMM PRO QUADRAT-CENTIMETER UND IN ENGL. PFUND PRO  
QUADRAT-ZOLL.

37ste SPALTE.

ERBAUER DER KESSEL, SOWIE ORT UND JAHR DER ERBAUUNG.  
BAUJAHR DES HÜLFSEKESSELS.

38ste SPALTE.

ORT UND ZEIT DER LETZTEN BESICHTIGUNG.

Eine einfache Orts- und Datum-Bezeichnung gibt an, dass nur  
eine teilweise Besichtigung der Kessel stattgefunden.  
V. C. bezeichnet dagegen eine vollständige Inspektion der gesamten  
Maschinen- und Kessel-Anlage.  
P. C. mit nachfolgendem Datum bezeichnet die Besichtigung des  
Hülfskessels.

Betreffs der Abkürzungen der Ortsnamen vergleiche man die  
Erläuterungen zu Spalte 19 des Segelschiffs-Registers.
